REFINEMENTS OF A TWO–SIDED INEQUALITY
FOR TRIGONOMETRIC FUNCTIONS

ZHEN–HANG YANG

Abstract. In this paper, we prove that for $x \in (0, \pi/2)$
\[(\cos p_1 x)^{1/(3p_1^2)} < \frac{\sin x}{x} < (\cos p_0 x)^{1/(3p_0^2)} < \cdots < e^{-x^2/6} < \frac{2 + \cos x}{3}\]
with the best constants $p_1 = 0.45346...$ and $p_0 = 1/\sqrt{5}$, and the function $p \mapsto (\cos px)^{1/(3p^2)}$ is decreasing on $(0, 1)$. Our results greatly refine Adamović-Mitrinović’s and Cusa’s inequality. As applications, some precise estimations for certain special functions and constants are presented.

Keywords and phrases: Adamović-Mitrinović’s inequality, Cusa’s inequality, trigonometric functions, sharp bound, refinement.
