

## DELAY–DIFFERENCE EQUATIONS WITH PERIODIC COEFFICIENTS: SHARP RESULTS IN OSCILLATION THEORY

Y. DOMSHLAK

*Abstract.* The following aspects of oscillation theory for Delay-difference equation

$$x(n+1) - x(n) + b(n)x(n-k) = 0, \quad k \in \mathbf{N}, b(n) \geq 0, n \geq n_0 \quad (1)$$

are investigated:

1. Two following facts *are equivalent*:
  - a) There exists at least one non-oscillatory solution of Eq. (1).
  - b) There is no regularly (slowly) oscillatory solution of Eq. (1).
2. An explicit condition for oscillation of all solutions of Eq. (1), in which  $b(n) \geq a(n) \geq 0$ ,  $a(n+r) = a(n) \forall n$ , is elaborated. In the particular case  $b(n) = a(n)$ ,  $\forall n$  it turns to the *sufficient and necessary condition*. For some particular cases  $\{r = k\}$ ;  $\{r = k+1\}$ ;  $\{k = 1, r = 3 \text{ or } 4\}$ ;  $\{r = 2\}$  this condition is formulated in a recognisable form *in terms of coefficients*.

*Mathematics subject classification* (1991): 39A10.

*Key words and phrases:* Difference equations, periodic coefficients, oscillation properties, non-oscillatory solutions.
