LÉVY–KHINTCHINE REPRESENTATION OF TOADER–QI MEAN

FENG QI AND BAI-NI GUO

Abstract. In the paper, by virtue of a Lévy-Khintchine representation and an alternative integral representation for the weighted geometric mean, the authors establish a Lévy-Khintchine representation and an alternative integral representation for the Toader-Qi mean, verify that the Toader-Qi mean is a Bernstein function and that the divided difference of the Toader-Qi mean is a Stieltjes function, and collect a probabilistic interpretation and an application in engineering of the Toader-Qi mean.

Keywords and phrases: Lévy-Khintchine representation, integral representation, Bernstein function, Stieltjes function, Toader-Qi mean, weighted geometric mean, Bessel function of the first kind, probabilistic interpretation, application in engineering, inequality.
