

FREDHOLMNESS AND INDEX OF OPERATORS IN THE WIENER ALGEBRA ARE INDEPENDENT OF THE UNDERLYING SPACE

MARKO LINDNER

Abstract. The purpose of this paper is to demonstrate the so-called Fredholm-inverse closedness of the Wiener algebra \mathscr{W} and to deduce independence of the Fredholm property and index of the underlying space. More precisely, we look at operators $A \in \mathscr{W}$ as acting on a family of vector valued ℓ^p spaces and show that the Fredholm regularizer of A for one of these spaces can always be chosen in \mathscr{W} as well and therefore regularizes A (modulo compact operators) on all of the ℓ^p spaces under consideration. We conclude that both Fredholmness and the index of A do not depend on the ℓ^p space that A is considered as acting on.

Mathematics subject classification (2000): 47A53, 47B37, 47L10, 47B36, 46E40.

Key words and phrases: Fredholm operator, Fredholm index, Wiener algebra, operators on ℓ^p spaces.
