A SHORT–TYPE DECOMPOSITION OF FORMS

ZOLTÁN SEBESTYÉN, ZSIGMOND TARCSAY AND TAMÁS TITKOS

Abstract. The main purpose of this paper is to present a decomposition theorem for nonnegative sesquilinear forms. The key notion is the short of a form to a linear subspace. This is a generalization of the well-known operator short defined by M. G. Krein. A decomposition of a form into a shorted part and a singular part (with respect to an other form) will be called short-type decomposition. As applications, we present some analogous results for bounded positive operators acting on a Hilbert space; for additive set functions on a ring of sets; and for representable positive functionals on a $\ast$-algebra.

Keywords and phrases: Lebesgue decomposition, nonnegative forms, positive operators, absolute continuity, singularity, generalized short.
