# AN EXTENSION OF HARTFIEL'S DETERMINANT INEQUALITY 

Lei Hou and Sheng Dong

(Communicated by F. Hansen)

Abstract. Let $A$ and $B$ be $n \times n$ positive definite matrices, Hartfiel obtained a lower bound for $\operatorname{det}(A+B)$. In this paper, we first extend his result to $\operatorname{det}(A+B+C)$, where $A, B$ and $C$ are $n \times n$ positive definite matrices, and then show a generalization of this to the case of matrices whose numerical ranges are contained in a sector.

## 1. Introduction

Let $A, B$ be $n \times n$ positive semidefinite matrice, it is well known that

$$
\begin{equation*}
\operatorname{det}(A+B) \geqslant \operatorname{det} A+\operatorname{det} B \tag{1}
\end{equation*}
$$

In [5], Haynsworth proved the following refinement of (1),

$$
\begin{equation*}
\operatorname{det}(A+B) \geqslant\left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} B_{k}}{\operatorname{det} A_{k}}\right) \operatorname{det} A+\left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} A_{k}}{\operatorname{det} B_{k}}\right) \operatorname{det} B . \tag{2}
\end{equation*}
$$

where $A_{k}, B_{k}, k=1, \cdots, n-1$, denote the $k$-th leading principal submatrices of positive definite matrices $A$ and $B$, respectively.

Later, Hartfiel [4] obtained an improvement of (2) as follows:

$$
\begin{align*}
\operatorname{det}(A+B) \geqslant & \left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} B_{k}}{\operatorname{det} A_{k}}\right) \operatorname{det} A+\left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} A_{k}}{\operatorname{det} B_{k}}\right) \operatorname{det} B  \tag{3}\\
& +\left(2^{n}-2 n\right) \sqrt{\operatorname{det} A \operatorname{det} B}
\end{align*}
$$

where $A_{k}, B_{k}$ are under the same condition as in (2). And the author also gave an interesting corollary:

$$
\begin{equation*}
\operatorname{det}(A+B) \geqslant \operatorname{det} A+\operatorname{det} B+\left(2^{n}-2\right) \sqrt{\operatorname{det} A \operatorname{det} B} \tag{4}
\end{equation*}
$$

In this paper, we fist extend Hartfiel's result by giving a lower bound for $\operatorname{det}(A+$ $B+C)$, where $A, B$ and $C$ are $n \times n$ positive definite matrices. And then, we show some generalizations of the matrix form of the new determinant inequalities to a larger class of matrices, namely, matrices whose numerical ranges are contained in a sector.

[^0]
## 2. Auxiliary results

Let $\mathbb{M}_{n}$ be the set of $n \times n$ complex matrices. If $A$ is positive semidefinite, we put $A \geqslant 0$, for two Hermitian matrices $A, B \in \mathbb{M}_{n}, A \geqslant B$ means $A-B$ is positive semidefinite. If $A$ is positive definite, we put $A>0$.

For $A \in \mathbb{M}_{n}$, recall the Cartesian decomposition (see, e.g. [6, p. 7])

$$
A=\Re A+i \subseteq A
$$

where

$$
\mathfrak{R} A=\frac{1}{2}\left(A+A^{*}\right), \quad \mathfrak{S} A=\frac{1}{2 i}\left(A-A^{*}\right) .
$$

We say $A \in \mathbb{M}_{n}$ is accretive-dissipative matrix if $\mathfrak{R} A$ and $\mathfrak{S} A$ are positive definie. For more details about this class of matrices, please refer to [3, 8, 9, 12].

The numerical range of $A \in \mathbb{M}_{n}$ is defined by

$$
W(A)=\left\{x^{*} A x \mid x \in \mathbb{C}^{n}, x^{*} x=1\right\}
$$

Also, for $\alpha \in\left[0, \frac{\pi}{2}\right)$, let $S_{\alpha}$ be the sector in the complex plane given by

$$
S_{\alpha}=\{z \in \mathbb{C}|\Re z>0,|\mathfrak{S} z| \leqslant(\Re z) \tan (\alpha)\}
$$

Clearly, if $W(A) \subset S_{0}$, then $A$ is positive definite. As $0 \notin S_{\alpha}$, if $W(A) \subset S_{\alpha}$, we can get that $A$ is necessarily nonsingular.

Relevant studies on matrices with numerical ranges in a sector can be found in [1, 2, 11, 7, 13].

Next, we present some lemmas which are useful for our proofs.
Lemma 1. [6, Theorem 7.8.19] Let $A \in \mathbb{M}_{n}$. If $\mathfrak{R}(A)>0$, then

$$
\operatorname{det}(\mathfrak{R}(A)) \leqslant|\operatorname{det}(A)|
$$

Lemma 2. [11, Lemma 2.6] Let $A \in \mathbb{M}_{n}$ with $W(A) \subset S_{\alpha}$. Then

$$
\sec ^{n}(\alpha) \operatorname{det}(\Re(A)) \geqslant|\operatorname{det}(A)|
$$

Lemma 3. [10, Theorem 1.1] Let $A, B, C$ be $n \times n$ positive definite matrices. Then

$$
\begin{array}{r}
\operatorname{det}(A+B+C)+\operatorname{det}(C)-(\operatorname{det}(A+C)+\operatorname{det}(B+C)) \\
\geqslant \operatorname{det}(A+B)-(\operatorname{det}(A)+\operatorname{det}(B)) \tag{5}
\end{array}
$$

Lemma 4. [11, Proposition 2.1] Let $A, B, C \in \mathbb{M}_{n}$, and partition $A$ as $A=$ $\left(\begin{array}{ll}A_{11} & A_{12} \\ A_{21} & A_{22}\end{array}\right)$ with $A_{11}$ square. If $W(A), W(B), W(C) \subset S_{\alpha}$, then $W(A+B+C) \subset S_{\alpha}$ and $W\left(A_{11}\right) \subset S_{\alpha}$.

## 3. Main results

In this section, we begin with extending inequality (3) and inequality (4) as follows:

THEOREM 1. Let $A, B, C$ be $n \times n$ positive definite matrices, $A_{k}, B_{k}, C_{k}, k=$ $1, \cdots, n-1$, denote the $k$-th leading principal submatrices of $A, B, C$, respectively. Then

$$
\begin{align*}
\operatorname{det}(A+B+C) \geqslant & \left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} B_{k}+\operatorname{det} C_{k}}{\operatorname{det} A_{k}}\right) \operatorname{det} A \\
& +\left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} A_{k}+\operatorname{det} C_{k}}{\operatorname{det} B_{k}}\right) \operatorname{det} B  \tag{6}\\
& +\left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} A_{k}+\operatorname{det} B_{k}}{\operatorname{det} C_{k}}\right) \operatorname{det} C \\
& +\left(2^{n}-2 n\right)(\sqrt{\operatorname{det} A B}+\sqrt{\operatorname{det} A C}+\sqrt{\operatorname{det} B C})
\end{align*}
$$

Proof. According to Lemma 3, we have

$$
\begin{align*}
\operatorname{det}(A+B+C) \geqslant & \operatorname{det}(A+B)+\operatorname{det}(A+C)+\operatorname{det}(B+C) \\
& -\operatorname{det} A-\operatorname{det} B-\operatorname{det} C \tag{7}
\end{align*}
$$

Then we can obtain, by (3), that

$$
\begin{aligned}
\operatorname{det}(A+B+C) \geqslant & \left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} B_{k}}{\operatorname{det} A_{k}}\right) \operatorname{det} A+\left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} A_{k}}{\operatorname{det} B_{k}}\right) \operatorname{det} B \\
& +\left(2^{n}-2 n\right) \sqrt{\operatorname{det} A B}+\left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} C_{k}}{\operatorname{det} A_{k}}\right) \operatorname{det} A \\
& +\left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} A_{k}}{\operatorname{det} C_{k}}\right) \operatorname{det} C+\left(2^{n}-2 n\right) \sqrt{\operatorname{det} A C} \\
& +\left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} C_{k}}{\operatorname{det} B_{k}}\right) \operatorname{det} B+\left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} B_{k}}{\operatorname{det} C_{k}}\right) \operatorname{det} C \\
& +\left(2^{n}-2 n\right) \sqrt{\operatorname{det} B C}-\operatorname{det} A-\operatorname{det} B-\operatorname{det} C \\
\geqslant & \left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} B_{k}+\operatorname{det} C_{k}}{\operatorname{det} A_{k}}\right) \operatorname{det} A+\left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} A_{k}+\operatorname{det} C_{k}}{\operatorname{det} B_{k}}\right) \operatorname{det} B \\
& +\left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} A_{k}+\operatorname{det} B_{k}}{\operatorname{det} C_{k}}\right) \operatorname{det} C \\
& +\left(2^{n}-2 n\right)(\sqrt{\operatorname{det} A B}+\sqrt{\operatorname{det} A C}+\sqrt{\operatorname{det} B C}) .
\end{aligned}
$$

By inequality (4) and Lemma 3, the following interesting theorem can be obtained.

THEOREM 2. Let $A, B, C$ be $n \times n$ positive definite matrices. Then

$$
\begin{align*}
\operatorname{det}(A+B+C) \geqslant & \operatorname{det} A+\operatorname{det} B+\operatorname{det} C \\
& +\left(2^{n}-2\right)(\sqrt{\operatorname{det} A B}+\sqrt{\operatorname{det} A C}+\sqrt{\operatorname{det} B C}) . \tag{8}
\end{align*}
$$

Now, we extend Theorem 1 and Theorem 2 to the case of matrices whose numerical ranges are contained in a sector.

Theorem 3. Let $A, B, C \in \mathbb{M}_{n}, W(A), W(B), W(C) \subset S_{\alpha}, \alpha \in\left[0, \frac{\pi}{2}\right)$ and let $A_{k}, B_{k}, C_{k}, k=1, \cdots, n-1$, denote the $k$-th leading principal submatrices of $A, B$, $C$, respectively. Then

$$
\begin{aligned}
\sec ^{n}(\alpha)|\operatorname{det}(A+B+C)| \geqslant & \left(1+\sum_{k=1}^{n-1} \cos ^{k}(\alpha) \frac{\left|\operatorname{det} B_{k}\right|+\left|\operatorname{det} C_{k}\right|}{\left|\operatorname{det} A_{k}\right|}\right)|\operatorname{det} A| \\
& +\left(1+\sum_{k=1}^{n-1} \cos ^{k}(\alpha) \frac{\left|\operatorname{det} A_{k}\right|+\left|\operatorname{det} C_{k}\right|}{\left|\operatorname{det} B_{k}\right|}\right)|\operatorname{det} B| \\
& +\left(1+\sum_{k=1}^{n-1} \cos ^{k}(\alpha) \frac{\left|\operatorname{det} A_{k}\right|+\left|\operatorname{det} B_{k}\right|}{\left|\operatorname{det} C_{k}\right|}\right)|\operatorname{det} C| \\
& +\left(2^{n}-2 n\right)(\sqrt{|\operatorname{det} A B|}+\sqrt{|\operatorname{det} A C|}+\sqrt{|\operatorname{det} B C|}) .
\end{aligned}
$$

Proof. According to Lemma 4, we have $W\left(A_{k}\right), W\left(B_{k}\right), W\left(C_{k}\right) \subset S_{\alpha}$. Compute

$$
\begin{aligned}
|\operatorname{det}(A+B+C)| \geqslant & \operatorname{det}(\Re(A+B+C)) \\
\geqslant & \left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} \Re\left(B_{k}\right)+\operatorname{det} \Re\left(C_{k}\right)}{\operatorname{det} \Re\left(A_{k}\right)}\right) \operatorname{det} \Re(A) \\
& +\left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} \Re\left(A_{k}\right)+\operatorname{det} \Re\left(C_{k}\right)}{\operatorname{det} \Re\left(B_{k}\right)}\right) \operatorname{det} \Re(B) \\
& +\left(1+\sum_{k=1}^{n-1} \frac{\operatorname{det} \Re\left(A_{k}\right)+\operatorname{det} \Re\left(B_{k}\right)}{\operatorname{det} \Re\left(C_{k}\right)}\right) \operatorname{det} \Re(C) \\
& +\left(2^{n}-2 n\right)(\sqrt{\operatorname{det} \Re(A) \operatorname{det} \Re(B)}+\sqrt{\operatorname{det} \Re(A) \operatorname{det} \Re(C)} \\
& +\sqrt{\operatorname{det} \Re(B) \operatorname{det} \Re(C)}) \\
\geqslant & \left(1+\sum_{k=1}^{n-1} \cos ^{k}(\alpha) \frac{\left|\operatorname{det} B_{k}\right|+\left|\operatorname{det} C_{k}\right|}{\left|\operatorname{det} A_{k}\right|}\right) \cos _{\alpha}^{n}|\operatorname{det} A| \\
& +\left(1+\sum_{k=1}^{n-1} \cos ^{k}(\alpha) \frac{\left|\operatorname{det} A_{k}\right|+\left|\operatorname{det} C_{k}\right|}{\left|\operatorname{det} B_{k}\right|}\right) \cos _{\alpha}^{n}|\operatorname{det} B| \\
& +\left(1+\sum_{k=1}^{n-1} \cos ^{k}(\alpha) \frac{\left|\operatorname{det} A_{k}\right|+\left|\operatorname{det} B_{k}\right|}{\left|\operatorname{det} C_{k}\right|}\right) \cos _{\alpha}^{n}|\operatorname{det} C| \\
& +\left(2^{n}-2 n\right) \cos ^{n}(\alpha)(\sqrt{|\operatorname{det} A B|}+\sqrt{|\operatorname{det} A C|}+\sqrt{|\operatorname{det} B C|}) .
\end{aligned}
$$

where the first inequality above is by Lemma 1 ; the second is due to the inequality (6) and the last inequality holds by Lemma 1 and Lemma 2.

Multiplying both sides of the inequality by $\sec ^{n}(\alpha)$ yields the desired inequality, which completes the proof.

When $\alpha=0$, Theorem 3 reduces to Theorem 1. Note that if $A$ is accretivedissipative, then $W\left(e^{-i \pi / 4} A\right) \subset S_{\pi / 4}$. Thus, we have the following corollary.

Corollary 1. Suppose $A, B, C \in \mathbb{M}_{n}$ are accretive-dissipative, let $A_{k}, B_{k}, C_{k}$, $k=1 \cdots n-1$, denote the $k$-th leading principal submatrices of $A, B, C$, respectively. Then

$$
\begin{aligned}
2^{\frac{n}{2}}|\operatorname{det}(A+B+C)| \geqslant & \left(1+\sum_{k=1}^{n-1} \frac{1}{2^{k / 2}} \frac{\left|\operatorname{det} B_{k}\right|+\left|\operatorname{det} C_{k}\right|}{\left|\operatorname{det} A_{k}\right|}\right)|\operatorname{det} A| \\
& +\left(1+\sum_{k=1}^{n-1} \frac{1}{2^{k / 2}} \frac{\left|\operatorname{det} A_{k}\right|+\left|\operatorname{det} C_{k}\right|}{\left|\operatorname{det} B_{k}\right|}\right)|\operatorname{det} B| \\
& +\left(1+\sum_{k=1}^{n-1} \frac{1}{2^{k / 2}} \frac{\left|\operatorname{det} A_{k}\right|+\left|\operatorname{det} B_{k}\right|}{\left|\operatorname{det} C_{k}\right|}\right)|\operatorname{det} C| \\
& +\left(2^{n}-2 n\right)(\sqrt{|\operatorname{det} A B|}+\sqrt{|\operatorname{det} A C|}+\sqrt{|\operatorname{det} B C|})
\end{aligned}
$$

For the generalization of Theorem 2, the following results can be obtained by Lemma 1 and Lemma 2.

Theorem 4. Let $A, B, C \in \mathbb{M}_{n}, W(A)$, $W(B)$, $W(C) \subset S_{\alpha}, \alpha \in\left[0, \frac{\pi}{2}\right)$. Then

$$
\begin{aligned}
\sec ^{n}(\alpha)|\operatorname{det}(A+B+C)| \geqslant & |\operatorname{det} A|+|\operatorname{det} B|+|\operatorname{det} C| \\
& +\left(2^{n}-2\right)(\sqrt{|\operatorname{det} A B|}+\sqrt{|\operatorname{det} A C|}+\sqrt{|\operatorname{det} B C|})
\end{aligned}
$$

Corollary 2. Let $A, B, C \in \mathbb{M}_{n}$ be accretive-dissipative. Then

$$
\begin{aligned}
2^{\frac{n}{2}}|\operatorname{det}(A+B+C)| \geqslant & |\operatorname{det} A|+|\operatorname{det} B|+|\operatorname{det} C| \\
& +\left(2^{n}-2\right)(\sqrt{|\operatorname{det} A B|}+\sqrt{|\operatorname{det} A C|}+\sqrt{|\operatorname{det} B C|}) .
\end{aligned}
$$
