# CONVERGENCE AND DECOMPOSITION FOR TENSOR PRODUCTS OF HILBERT SPACE OPERATORS 

C. S. Kubrusly and P. C. M. Vieira

(communicated by B. Magajna)

#### Abstract

It is shown that convergence of sequences of Hilbert space operators is preserved by tensor product and the converse holds in case of convergence to zero under the semigroup assumption. In particular, unlike ordinary product of operators, weak convergence is preserved by tensor product. It is also shown that a tensor product of operators is a unilateral shift if and only if it coincides with a tensor product of a unilateral shift and an isometry. These results lead to a decomposition of a tensor product of contractions into an orthogonal direct sum of tensor products of class $\mathscr{C}_{00}$, strongly stable tensor products, unilateral shift tensor products, and a unitary tensor product.

## 1. Introduction

Let $\mathscr{H}$ and $\mathscr{K}$ be nonzero complex Hilbert spaces. We shall consider the concept of tensor product space in terms of the single tensor product of vectors as a conjugate bilinear functional on the Cartesian product of $\mathscr{H}$ and $\mathscr{K}$. (See e.g., [4], [10] and [11] - for an abstract approach see e.g., [1] and [14].) The single tensor product of $x \in \mathscr{H}$ and $y \in \mathscr{K}$ is a conjugate bilinear functional $x \otimes y: \mathscr{H} \times \mathscr{K} \rightarrow \mathbb{C}$ defined by $(x \otimes y)(u, v)=\langle x ; u\rangle\langle y ; v\rangle$ for every $(u, v) \in \mathscr{H} \times \mathscr{K}$. The collection of all (finite) sums of single tensors $x_{i} \otimes y_{i}$ with $x_{i} \in \mathscr{H}$ and $y_{i} \in \mathscr{K}$, denoted by $\mathscr{H} \otimes \mathscr{K}$, is a complex linear space equipped with an inner product $\langle;\rangle:(\mathscr{H} \otimes \mathscr{K}) \times(\mathscr{H} \otimes \mathscr{K}) \rightarrow \mathbb{C}$ defined, for arbitrary $\sum_{i=1}^{N} x_{i} \otimes y_{i}$ and $\sum_{j=1}^{M} w_{j} \otimes z_{j}$ in $\mathscr{H} \otimes \mathscr{K}$, by

$$
\left\langle\sum_{i=1}^{N} x_{i} \otimes y_{i} ; \sum_{j=1}^{M} w_{j} \otimes z_{j}\right\rangle=\sum_{i=1}^{N} \sum_{j=1}^{M}\left\langle x_{i} ; w_{j}\right\rangle\left\langle y_{i} ; z_{j}\right\rangle
$$

(the same notation for the inner products on $\mathscr{H}, \mathscr{K}$ and $\mathscr{H} \otimes \mathscr{K})$. By an operator we mean a bounded linear transformation of a normed space into itself. Let $\mathscr{B}[\mathscr{H}]$, $\mathscr{B}[\mathscr{K}]$ and $\mathscr{B}[\mathscr{H} \otimes \mathscr{K}]$ be the normed algebras of all operators on $\mathscr{H}, \mathscr{K}$ and $\mathscr{H} \otimes \mathscr{K}$. The tensor product on $\mathscr{H} \otimes \mathscr{K}$ of two operators $T$ in $\mathscr{B}[\mathscr{H}]$ and $S$ in $\mathscr{B}[\mathscr{K}]$ is the operator $T \otimes S: \mathscr{H} \otimes \mathscr{K} \rightarrow \mathscr{H} \otimes \mathscr{K}$ defined by

Mathematics subject classification (2000): 47A80, 47A45.
Key words and phrases: Tensor product, Hilbert space operators, convergence, decompositions.

$$
(T \otimes S) \sum_{i=1}^{N} x_{i} \otimes y_{i}=\sum_{i=1}^{N} T x_{i} \otimes S y_{i} \quad \text { for every } \quad \sum_{i=1}^{N} x_{i} \otimes y_{i} \in \mathscr{H} \otimes \mathscr{K}
$$

which lies in $\mathscr{B}[\mathscr{H} \otimes \mathscr{K}]$. The completion of the inner product space $\mathscr{H} \otimes \mathscr{K}$, denoted by $\mathscr{H} \widehat{\otimes} \mathscr{K}$, is the tensor product space of $\mathscr{H}$ and $\mathscr{K}$. The extension of $T \otimes S$ over the Hilbert space $\mathscr{H} \widehat{\otimes} \mathscr{K}$, denoted by $T \widehat{\otimes} S$, is the tensor product of $T$ and $S$ on the tensor product space, which lies in $\mathscr{B}[\mathscr{H} \widehat{\otimes} \mathscr{K}]$. For an expository paper containing the essential properties of tensor products needed here, the reader is referred to [6].

It is exhibited in Theorem 4 a decomposition of a tensor product contraction $T \widehat{\otimes} S$ into an orthogonal direct sum of tensor products of class $\mathscr{C}_{00}$, strongly stable tensor products, unilateral shift tensor products, and a unitary tensor product. This is done after showing in Theorem 1 that weak, strong and uniform convergences are preserved by tensor product. The case of convergence to zero is considered in Theorem 2, and the converse is investigated in Theorem 3 under the semigroup assumption (i.e., for power sequences). The above mentioned decomposition is also based on Lemma 1, which ensures that a tensor product is a unilateral shift if and only if it coincides with a tensor product of a unilateral shift and an isometry.

## 2. Convergence

A sequence $\left\{T_{n}\right\}$ of operators in $\mathscr{B}[\mathscr{H}]$ converges uniformly, or strongly, or weakly to an operator $T$ in $\mathscr{B}[\mathscr{H}]$ if $\left\|T_{n}-T\right\| \rightarrow 0$, or $\left\|\left(T_{n}-T\right) x\right\| \rightarrow 0$ for every $x$ in $\mathscr{H}$, or $\left\langle T_{n} x ; y\right\rangle \rightarrow 0$ for every $x$ and $y$ in $\mathscr{H}$ (equivalently, $\left\langle T_{n} x ; x\right\rangle \rightarrow 0$ for every $x$ in the complex Hilbert space $\mathscr{H}$ ), and these will be denoted by $T_{n} \xrightarrow{u} T$, or $T_{n} \xrightarrow{s} T$, or $T_{n} \xrightarrow{w} T$, respectively. It is bounded if $\sup _{n}\left\|T_{n}\right\|<\infty$. Clearly,

$$
T_{n} \xrightarrow{u} T \quad T_{n} \xrightarrow{s} T \quad \Longrightarrow \quad T_{n} \xrightarrow{w} T \quad \Longrightarrow \quad \sup _{n}\left\|T_{n}\right\|<\infty .
$$

THEOREM 1. Let $\left\{T_{n}\right\}$ be a sequence of operators in $\mathscr{B}[\mathscr{H}]$ and let $\left\{S_{n}\right\}$ be a sequence of operators in $\mathscr{B}[\mathscr{K}]$. Let $T$ and $S$ be operators in $\mathscr{B}[\mathscr{H}]$ and in $\mathscr{B}[\mathscr{K}]$.
(a) If $T_{n} \xrightarrow{u} T$ and $S_{n} \xrightarrow{u} S$, then $T_{n} \widehat{\otimes} S_{n} \xrightarrow{u} T \widehat{\otimes} S$.
(b) If $T_{n} \xrightarrow{s} T$ and $S_{n} \xrightarrow{s} S$, then $T_{n} \widehat{\otimes} S_{n} \xrightarrow{s} T \widehat{\otimes} S$.
(c) If $T_{n} \xrightarrow{w} T$ and $S_{n} \xrightarrow{w} S$, then $T_{n} \widehat{\otimes} S_{n} \xrightarrow{w} T \widehat{\otimes} S$.

Proof. Recall that $T_{n} \otimes S_{n}-T \otimes S=T_{n} \otimes\left(S_{n}-S\right)+\left(T_{n}-T\right) \otimes S$ for each $n$, which still holds if $\otimes$ is replaced with $\widehat{\otimes}$ (see e.g., $\left[6\right.$, Propositions $2\left(\mathrm{~b}_{1}, \mathrm{~b}_{2}\right)$ $\left.\left.4\left(\mathrm{~b}_{1}, \mathrm{~b}_{2}\right)\right]\right)$.
(a) If $\left\|T_{n}-T\right\| \rightarrow O$ (so that $\left\{T_{n}\right\}$ is bounded) and $\left\|S_{n}-S\right\| \rightarrow O$, then

$$
\left\|T_{n} \widehat{\otimes} S_{n}-T \widehat{\otimes} S\right\| \leqslant \sup _{n}\left\|T_{n}\right\|\left\|S_{n}-S\right\|+\|S\|\left\|T_{n}-T\right\|
$$

and hence $\left\|T_{n} \widehat{\otimes} S_{n}-T \widehat{\otimes} S\right\| \rightarrow 0$. That is, $T_{n} \widehat{\otimes} S_{n} \xrightarrow{u} T \widehat{\otimes} S$.
(b) Take an arbitrary $\sum_{i=1}^{N} x_{i} \otimes y_{i}$ in $\mathscr{H} \otimes \mathscr{K}$ and observe that

$$
\begin{aligned}
& \left\|\left(T_{n} \otimes S_{n}-T \otimes S\right) \sum_{i=1}^{N} x_{i} \otimes y_{i}\right\| \\
& \quad \leqslant \sup _{n}\left\|T_{n}\right\| \sum_{i=1}^{N}\left\|x_{i}\right\| \sum_{i=1}^{N}\left\|\left(S_{n}-S\right) y_{i}\right\|+\|S\| \sum_{i=1}^{N}\left\|y_{i}\right\| \sum_{i=1}^{N}\left\|\left(T_{n}-T\right) x_{i}\right\| .
\end{aligned}
$$

If $S_{n} \xrightarrow{s} S$ and $T_{n} \xrightarrow{s} T$, then $\left\|\left(T_{n} \otimes S_{n}-T \otimes S\right) \sum_{i=1}^{N} x_{i} \otimes y_{i}\right\| \rightarrow 0$, and so $T_{n} \otimes S_{n} \xrightarrow{s} T \otimes S$. Moreover, $\left\{T_{n} \widehat{\otimes} S_{n}\right\}$ is bounded (because $\sup _{n}\left\|T_{n} \widehat{\otimes} S_{n}\right\| \leqslant$ $\left.\sup _{n}\left\|T_{n}\right\| \sup _{n}\left\|S_{n}\right\|<\infty\right)$. As it is well-known, if a sequence of operators converges strongly in a normed space, and if its extension is bounded in the completion, then convergence holds in the completion of the space. Thus $T_{n} \widehat{\otimes} S_{n} \xrightarrow{s} T \widehat{\otimes} S$.
(c) Similarly, and applying the Schwarz inequality,

$$
\begin{aligned}
& \left|\left\langle\left(T_{n} \otimes S_{n}-T \otimes S\right) \sum_{i=1}^{N} x_{i} \otimes y_{i} ; \sum_{i=1}^{N} x_{i} \otimes y_{i}\right\rangle\right| \\
& \leqslant \sup _{n}\left\|T_{n}\right\| \sum_{i=1}^{N} \sum_{j=1}^{N}\left\|x_{i}\right\|\left\|x_{j}\right\| \sum_{i=1}^{N} \sum_{j=1}^{N}\left|\left\langle\left(S_{n}-S\right) y_{i} ; y_{j}\right\rangle\right| \\
& \quad+\|S\| \sum_{i=1}^{N} \sum_{j=1}^{N}\left\|y_{i}\right\|\left\|y_{j}\right\| \sum_{i=1}^{N} \sum_{j=1}^{N}\left|\left\langle\left(T_{n}-T\right) x_{i} ; x_{j}\right\rangle\right|
\end{aligned}
$$

Thus $\left|\left\langle\left(T_{n} \otimes S_{n}-T \otimes S\right) \sum_{i=1}^{N} x_{i} \otimes y_{i} ; \sum_{i=1}^{N} x_{i} \otimes y_{i}\right\rangle\right| \rightarrow 0$, whenever $S_{n} \xrightarrow{w} S$ and $T_{n} \xrightarrow{w} T$, and so $T_{n} \otimes S_{n} \xrightarrow{w} T \otimes S$. The same argument applies for weak convergence so that $T_{n} \widehat{\otimes} S_{n} \xrightarrow{w} T \widehat{\otimes} S$.

REMARK 1. The result in Theorem 1 (c) does not mirror the ordinary product counterpart. Indeed, $T_{n} \xrightarrow{w} T$ and $S_{n} \xrightarrow{w} S$ do not imply $T_{n} S_{n} \xrightarrow{w} T S$ (in fact, even $T_{n} \xrightarrow{s} T$ and $S_{n} \xrightarrow{w} S$ do not imply $T_{n} S_{n} \xrightarrow{w} T S$ ). Sample: if $V$ is a unilateral shift, put $T_{n}^{*}=S_{n}=V^{n}$ so that $T_{n} \xrightarrow{s} O, S_{n} \xrightarrow{w} O$, but $T_{n} S_{n}=I$ for every $n$.

THEOREM 2. Let $\left\{T_{n}\right\}$ and $\left\{S_{n}\right\}$ be sequences ofoperators in $\mathscr{B}[\mathscr{H}]$ and $\mathscr{B}[\mathscr{K}]$, respectively. If one of them converges to zero uniformly (strongly, weakly) and the other is bounded, then $\left\{T_{n} \widehat{\otimes} S_{n}\right\}$ converges to zero uniformly (strongly, weakly).

Proof. If $\left\|T_{n}\right\| \rightarrow 0$ and $\sup _{n}\left\|S_{n}\right\|<\infty$ (or vice versa), then $\left\|T_{n} \widehat{\otimes} S_{n}\right\| \rightarrow 0$ because $\left\|T_{n} \widehat{\otimes} S_{n}\right\|=\left\|T_{n} \otimes S_{n}\right\|=\left\|T_{n}\right\|\left\|S_{n}\right\|$ for every $n \geqslant 1$, which proves the claimed result for uniform convergence. For strong and weak convergences take an arbitrary vector $\sum_{i=1}^{N} x_{i} \otimes y_{i}$ in $\mathscr{H} \otimes \mathscr{K}$. Note that

$$
\left\|\left(T_{n} \otimes S_{n}\right) \sum_{i=1}^{N} x_{i} \otimes y_{i}\right\| \leqslant \sup _{n}\left\|S_{n}\right\| \sum_{i=1}^{N}\left\|T_{n} x_{i}\right\| \sum_{i=1}^{N}\left\|y_{i}\right\| .
$$

If $\left\{T_{n}\right\}$ converges strongly to zero and if $\left\{S_{n}\right\}$ is bounded (or vice versa), then $\left\|\left(T_{n} \otimes S_{n}\right) \sum_{i=1}^{N} x_{i} \otimes y_{i}\right\| \rightarrow 0$. Applying the same argument in the proof of Theorem 1(b) we get $T_{n} \widehat{\otimes} S_{n} \xrightarrow{s} O$. Similarly,

$$
\left|\left\langle\left(T_{n} \otimes S_{n}\right) \sum_{i=1}^{N} x_{i} \otimes y_{i} ; \sum_{i=1}^{N} x_{i} \otimes y_{i}\right\rangle\right| \leqslant \sup _{n}\left\|S_{n}\right\| \sum_{i=1}^{N} \sum_{j=1}^{N}\left|\left\langle T_{n} x_{i} ; x_{j}\right\rangle\right| \sum_{i=1}^{N} \sum_{j=1}^{N}\left\|y_{i}\right\|\left\|y_{j}\right\| .
$$

If $\left\{T_{n}\right\}$ converges weakly to zero and if $\left\{S_{n}\right\}$ is bounded (or vice versa), then $\left\langle\left(T_{n} \otimes S_{n}\right) \sum_{i=1}^{N} x_{i} \otimes y_{i} ; \sum_{i=1}^{N} x_{i} \otimes y_{i}\right\rangle \rightarrow 0$. Again, applying the same argument in the proof of Theorem $1(\mathrm{c})$, it follows that $T_{n} \widehat{\otimes} S_{n} \xrightarrow{w} O$.

REMARK 2. A tensor product sequence $\left\{T_{n} \widehat{\otimes} S_{n}\right\}$ may converge in every topology and both sequences $\left\{T_{n}\right\}$ and $\left\{S_{n}\right\}$ may not converge in any topology (actually, both sequences may not even be bounded). For instance, put $T_{n}=n I$ if $n$ is odd and $T_{n}=O$ if $n$ is even, and $S_{n}=O$ if $n$ is odd and $S_{n}=n I$ if $n$ is even, so that $\left\|T_{n} \widehat{\otimes} S_{n}\right\|=\left\|T_{n}\right\|\left\|S_{n}\right\|=0$. However, in general, we always have

$$
\begin{equation*}
\inf _{n}\left\|T_{n}\right\| \sup _{n}\left\|S_{n}\right\| \leqslant \sup _{n}\left(\left\|T_{n}\right\|\left\|S_{n}\right\|\right)=\sup _{n}\left\|T_{n} \widehat{\otimes} S_{n}\right\| \tag{*}
\end{equation*}
$$

(if we declare that $0 \cdot \infty=0$ ). Theorem 3 below shows that, unlike the above example, convergence to zero of power sequences (or, equivalently, of sequences having the semigroup property) is transferred from the tensor product to one of the factors. First we consider the following auxiliary result.

PROPOSITION 1. If the power sequence $\left\{T^{n} \widehat{\otimes} S^{n}\right\}$ is bounded, then so is one of the power sequences $\left\{T^{n}\right\}$ or $\left\{S^{n}\right\}$.

Proof. Since $(T \widehat{\otimes} S)^{n}=T^{n} \widehat{\otimes} S^{n}$ for every $n \geqslant 0$, the above statement says that if $T \widehat{\otimes} S$ is power bounded, then so is one of $T$ or $S$. Indeed, suppose $T \widehat{\otimes} S$ is power bounded so that $\inf _{n}\left\|T^{n}\right\| \sup _{n}\left\|S^{n}\right\|<\infty$ by (*). If one of $T$ or $S$, say $T$, is not power bounded, then $\inf _{n}\left\|T^{n}\right\| \geqslant 1\left(\right.$ since $_{\inf }^{n}\left\|T^{n}\right\|<1$ implies $\left\|T^{n}\right\| \rightarrow 0$; cf. (a) in the proof of Theorem 3 below). Hence $\sup _{n}\left\|S^{n}\right\| \leqslant \inf _{n}\left\|T^{n}\right\| \sup _{n}\left\|S^{n}\right\|$ and so $S$ is power bounded. Similarly, if $S$ is not power bounded, then $T$ must be.

Let $\{n\}_{n \geqslant 0}$ denote the self indexing of the set of all nonnegative integers $\mathbb{N}_{0}$ equipped with the natural order. We say that a subsequence $\left\{n_{k}\right\}_{k \geqslant 0}$ of $\{n\}_{n \geqslant 0}$ is of bounded increments if $\sup _{k \geqslant 0}\left(n_{k+1}-n_{k}\right)<\infty$, and that a Hilbert space operator $T$ is power incremented if either the power sequence $\left\{T^{n}\right\}$ converges weakly to zero or there exists a subsequence of bounded increments $\left\{n_{k}\right\}_{k \geqslant 0}$ of $\{n\}_{n \geqslant 0}$ such that $\lim \sup _{k}\left|\left\langle T^{n_{k}} x ; y\right\rangle\right|>0$ whenever $\left\langle T^{n} x ; y\right\rangle \nrightarrow 0$ for some pair of vectors $x$ and $y$.

THEOREM 3. Let $T$ be an operator in $\mathscr{B}[\mathscr{H}]$ and let $S$ be an operator in $\mathscr{B}[\mathscr{K}]$. Consider the power sequences $\left\{T^{n}\right\}$ and $\left\{S^{n}\right\}$. If $\left\{T^{n} \widehat{\otimes} S^{n}\right\}$ converges to zero uniformly or strongly, then so does one of the sequences $\left\{T^{n}\right\}$ or $\left\{S^{n}\right\}$. If $\left\{T^{n} \widehat{\otimes} S^{n}\right\}$ converges to zero weakly, and one of $T$ or $S$ is power incremented, then one of the sequences $\left\{T^{n}\right\}$ or $\left\{S^{n}\right\}$ converges to zero weakly.

Proof. First recall that $(T \widehat{\otimes} S)^{n}=T^{n} \widehat{\otimes} S^{n}$ for each nonnegative integer $n$.
Part 1: Uniform Convergence.
(a)

$$
\text { If } \inf _{n}\left\|T^{n}\right\|<1, \text { then }\left\|T^{n}\right\| \rightarrow 0
$$

Indeed, if $\inf _{n}\left\|T^{n}\right\|<1$, then there is a positive integer $n_{0}$ such that $\left\|T^{n_{0}}\right\|<1$. Thus (with $r(T)$ denoting the spectral radius of any operator $T$ in $\mathscr{B}[\mathscr{H}]$ ),

$$
r(T)^{n_{0}}=r\left(T^{n_{0}}\right) \leqslant\left\|T^{n_{0}}\right\|<1 \quad \Longrightarrow \quad r(T)<1 \quad \Longleftrightarrow \quad\left\|T^{n}\right\| \rightarrow 0
$$

Now suppose $\left\|T^{n} \widehat{\otimes} S^{n}\right\| \rightarrow 0$ and recall that $\left\|T^{n} \widehat{\otimes} S^{n}\right\|=\left\|T^{n}\right\|\left\|S^{n}\right\|$ for every $n$.
(b)

$$
\text { If } \inf _{n}\left\|T^{n}\right\|>0, \text { then }\left\|S^{n}\right\| \rightarrow 0
$$

In fact, $\inf _{n}\left\|T^{n}\right\|>0$ if and only if $\liminf _{n}\left\|T^{n}\right\|>0$ (reason: $\left\|T^{n+1}\right\| \leqslant\|T\|\left\|T^{n}\right\|$ ). Since $\left\|T^{n}\right\|\left\|S^{n}\right\| \rightarrow 0$, it then follows that if ${\lim \inf _{n}\left\|T^{n}\right\|>0 \text {, then }\left\|S^{n}\right\| \rightarrow 0 \text {. From }}_{\text {a }}$ (a) and (b) we get the claimed result for uniform convergence.

Part 2 : Strong Convergence. If the sequence $\left\{T^{n} \widehat{\otimes} S^{n}\right\}$ converges strongly, then it is bounded (i.e., $T \widehat{\otimes} S$ is power bounded, since $(T \widehat{\otimes} S)^{n}=T^{n} \widehat{\otimes} S^{n}$ ), and so is one of $\left\{T^{n}\right\}$ and $\left\{S^{n}\right\}$ (i.e., one of $T$ or $S$ is power bounded) by Proposition 1. Thus, with no loss of generality, suppose $T$ is power bounded: $\sup _{n}\left\|T^{n}\right\|<\infty$.
(c) If $\liminf _{n}\left\|T^{n} x\right\|=0$ for every $x \in \mathscr{H}$, then $\left\|T^{n} x\right\| \rightarrow 0$ for every $x \in \mathscr{H}$.

Indeed, take any $x \in \mathscr{H}$. If $\liminf _{n}\left\|T^{n} x\right\|=0$, then there exists a subsequence $\left\{\left\|T^{n_{k}} x\right\|\right\}$ of $\left\{\left\|T^{n} x\right\|\right\}$ such that $\lim _{k}\left\|T^{n_{k}} x\right\| \rightarrow 0$. Since $\sup _{n}\left\|T^{n}\right\|<\infty$, and since $T^{m+n}=T^{m} T^{n}$ for every $m \geqslant 0$ and $n \geqslant 0$, this ensures that $\left\|T^{n} x\right\| \rightarrow 0$. Actually,

$$
\left\|T^{n} x\right\| \leqslant\left\|T^{n-n_{k}}\right\|\left\|T^{n_{k}} x\right\| \leqslant \sup _{n}\left\|T^{n}\right\|\left\|T^{n_{k}} x\right\| \quad \text { whenever } \quad n \geqslant n_{k}
$$

Now suppose $\left\{T^{n} \widehat{\otimes} S^{n}\right\}$ converges strongly to zero. Since for each integer $n \geqslant 0$

$$
\left\|(T \widehat{\otimes} S)^{n} x \otimes u\right\|=\left\|T^{n} x \otimes S^{n} u\right\|=\left\|T^{n} x\right\|\left\|S^{n} u\right\|
$$

for every $x \in \mathscr{H}$ and $u \in \mathscr{K}$, it follows that $\left\|T^{n} x\right\|\left\|S^{n} u\right\| \rightarrow 0$ for every $x \in \mathscr{H}$ and $u \in \mathscr{K}$, which ensures the next assertion.
(d) If $\liminf _{n}\left\|T^{n} x\right\|>0$ for some $x \in \mathscr{H}$, then $\left\|S^{n} u\right\| \rightarrow 0$ for every $u \in \mathscr{K}$.

From (c) and (d) we get the claimed result for strong convergence.
Part 3 : Weak Convergence. Take an arbitrary $x$ in $\mathscr{H}$.
(e) If there exists a subsequence of bounded increments $\left\{n_{k}\right\}_{k \geqslant 0}$ of $\{n\}_{n \geqslant 0}$ such that $\left|\left\langle T^{n_{k}} x ; y\right\rangle\right| \rightarrow 0$ for every $y$ in $\mathscr{H}$, then $\left|\left\langle T^{n} x ; x\right\rangle\right| \rightarrow 0$.

Indeed, take any $x \in \mathscr{H}$. Let $\left\{n_{k}\right\}_{k \geqslant 0}$ be a subsequence of $\{n\}_{n \geqslant 0}$, of bounded increments, such that

$$
\left|\left\langle T^{n_{k}} x ; y\right\rangle\right| \rightarrow 0 \text { as } k \rightarrow \infty \text { for every } y \in \mathscr{H}
$$

Since $T^{m+n}=T^{m} T^{n}$ for every $m \geqslant 0$ and $n \geqslant 0$, it follows that, for each $j \geqslant 0$,

$$
\left|\left\langle T^{n_{k}+j} x ; x\right\rangle\right|=\left|\left\langle T^{n_{k}} x ; T^{* j} x\right\rangle\right| \rightarrow 0 \text { as } k \rightarrow \infty
$$

However, If $\left\{\alpha_{n}\right\}_{n \geqslant 0}$ is a sequence of nonnegative numbers, and if there exists a subsequence of bounded increments $\left\{n_{k}\right\}_{k \geqslant 0}$ of $\{n\}_{n \geqslant 0}$ such that $\alpha_{n_{k}+j} \rightarrow 0$ as $k \rightarrow \infty$ for every $j \geqslant 0$, then $\alpha_{n} \rightarrow 0$ as $n \rightarrow \infty$. Thus

$$
\left|\left\langle T^{n} x ; x\right\rangle\right| \rightarrow 0 \text { as } n \rightarrow \infty
$$

Now suppose $\left\{T^{n} \widehat{\otimes} S^{n}\right\}$ converges weakly to zero and that one of $T$ or $S$, say $T$ (with no loss of generality), is power incremented. Since, for each integer $n \geqslant 0$,

$$
\left|\left\langle(T \widehat{\otimes} S)^{n} x \otimes u ; y \otimes v\right\rangle\right|=\left|\left\langle T^{n} \widehat{\otimes} S^{n} x \otimes u ; y \otimes v\right\rangle\right|=\left|\left\langle T^{n} x ; y\right\rangle\right|\left|\left\langle S^{n} u ; v\right\rangle\right|
$$

for every $x, y \in \mathscr{H}$ and $u, v \in \mathscr{K}$, it follows that $\left|\left\langle T^{n} x ; y\right\rangle \|\left\langle S^{n} u ; v\right\rangle\right| \rightarrow 0$ for every $x, y$ in $\mathscr{H}$ and $u, v$ in $\mathscr{K}$.
(f) If for every subsequence of bounded increments $\left\{n_{k}\right\}_{k \geqslant 0}$ of $\{n\}_{n \geqslant 0}$ there exists $y$ in $\mathscr{H}$ such that $\left|\left\langle T^{n_{k} x} ; y\right\rangle\right| \nrightarrow 0$, then $\left|\left\langle S^{n} u ; u\right\rangle\right| \rightarrow 0$ for every $u$ in $\mathscr{K}$.

Indeed, if the hypothesis in (f) holds, then it holds, in particular, for the whole sequence $\{n\}_{n \geqslant 0}$ so that $\left|\left\langle T^{n} x ; y\right\rangle\right| \nrightarrow 0$ for some $y$ in $\mathscr{H}$. Hence there exists a subsequence of $\left\{n_{k}\right\}_{k \geqslant 0}$ of $\{n\}_{n \geqslant 0}$ such that $\liminf _{k}\left|\left\langle T^{n_{k} x} ; y\right\rangle\right|>0$. If $T$ is power incremented, then we may assume that $\left\{n_{k}\right\}_{k \geqslant 0}$ is of bounded increments. Since $\left|\left\langle T^{n} x ; y\right\rangle \|\left\langle S^{n} u ; v\right\rangle\right| \rightarrow 0$, it follows that $\left|\left\langle T^{n_{k}} x ; y\right\rangle \|\left\langle S^{n_{k}} u ; v\right\rangle\right| \rightarrow 0$, and therefore $\left|\left\langle S^{n_{k}} u ; v\right\rangle\right| \rightarrow 0$ for every $u, v$ in $\mathscr{K}$. Thus take an arbitrary $u$ in $\mathscr{K}$. Since $\left\{n_{k}\right\}_{k \geqslant 0}$ is a subsequence of bounded increments of $\{n\}_{n \geqslant 0}$ such that $\left|\left\langle S^{n_{k}} u ; v\right\rangle\right| \rightarrow 0$ for every $v$ in $\mathscr{K}$, it follows by (e) that

$$
\left|\left\langle S^{n} u ; u\right\rangle\right| \rightarrow 0 \text { as } n \rightarrow \infty .
$$

From (e) and (f) we get the claimed result for weak convergence.
An operator $T$ is uniformly, strongly or weakly stable if the power sequence $\left\{T^{n}\right\}$ converges uniformly, strongly or weakly to zero. Preservation of uniform stability can be viewed as a consequence of the spectrum formula $\sigma(T \widehat{\otimes} S)=\sigma(T) \cdot \sigma(S)$ for a pair operators [2]. Preservation of strong stability as in [3, Theorem 1] and [7, Proposition 1] is a particular case of Theorems 2 and 3. It still remains open whether weak stability in Theorem 3 holds without the power increment assumption.

## 3. Decompositions

Let $T^{*} \in \mathscr{B}[\mathscr{H}]$ denote the adjoint of $T \in \mathscr{B}[\mathscr{H}]$. A contraction is an operator $T$ such that $\|T\| \leqslant 1$. If $T$ is a contraction, then the sequence $\left\{T^{* n} T^{n}\right\}$ converges strongly. Let $A_{T} \in \mathscr{B}[\mathscr{H}]$ be the strong limit of $\left\{T^{* n} T^{n}\right\}$. The following basic properties of $A_{T}$ will be required in the sequel (see [5, Chapter 3]): $O \leqslant A_{T} \leqslant I$ (i.e., $A_{T}$ is a nonnegative contraction) and $\left\|A_{T}\right\|=1$ if $A_{T} \neq O$. Moreover, if $A_{T}=A_{T^{*}}$, then $A_{T}$ is a projection, (i.e., $A_{T}=A_{T}^{2}$ ). Furthermore, a contraction $T$ is strongly stable if and only if $A_{T}=O$. According to [13] a $\mathscr{C}_{0}$. -contraction (or a contraction of class $\mathscr{C}_{0}$.) is a strongly stable contraction (i.e., a contraction $T$ with $A_{T}=O$ ), and a $\mathscr{C}_{00}$-contraction (or a contraction of class $\mathscr{C}_{00}$ ) is a strongly stable contraction whose adjoint also is strongly stable (i.e., a contraction $T$ with $A_{T}=A_{T^{*}}=O$ ).

Corollary 1. If $T$ and $S$ are Hilbert space contractions, then
(a)

$$
A_{T} \widehat{\otimes} S=A_{T} \widehat{\otimes} A_{S}
$$

If both $A_{T}$ and $A_{S}$ are nonzero, then
(b)

$$
\begin{gather*}
A_{T \widehat{\otimes} S}=A_{(T \widehat{\otimes} S)^{*}} \quad \text { implies } \quad A_{T}=A_{T^{*}} \text { and } A_{S}=A_{S^{*}} \\
A_{T \widehat{\otimes} S}=A_{T \widehat{\otimes} S}^{2} \quad \text { implies } \quad A_{T}=A_{T}^{2} \text { and } A_{S}=A_{S}^{2} \tag{c}
\end{gather*}
$$

Proof. (a) Since $T \widehat{\otimes} S$ is a contraction in $\mathscr{B}[\mathscr{H} \widehat{\otimes} \mathscr{K}]$ whenever $T$ and $S$ are contractions in $\mathscr{B}[\mathscr{H}]$ and $\mathscr{B}[\mathscr{K}]$, it follows that the sequence $\left\{(T \widehat{\otimes} S)^{* n}(T \widehat{\otimes} S)^{n}\right\}$ converges strongly to a nonnegative contraction $A_{T \widehat{\otimes} S}$ in $\mathscr{B}[\mathscr{H} \widehat{\otimes} \mathscr{K}]$. Since

$$
T^{* n} T^{n} \xrightarrow{s} A_{T}, \quad S^{* n} S^{n} \xrightarrow{s} A_{S},
$$

and

$$
(T \widehat{\otimes} S)^{* n}(T \widehat{\otimes} S)^{n}=\left(T^{* n} \widehat{\otimes} S^{* n}\right)\left(T^{n} \widehat{\otimes} S^{n}\right)=T^{* n} T^{n} \widehat{\otimes} S^{* n} S^{n}
$$

it follows by Theorem 1 that

$$
(T \widehat{\otimes} S)^{* n}(T \widehat{\otimes} S)^{n} \xrightarrow{s} A_{T} \widehat{\otimes} A_{S}
$$

and so $A_{T} \widehat{\otimes} S=A_{T} \widehat{\otimes} A_{S}$ by uniqueness of the strong limit.
(b) Since $(T \widehat{\otimes} S)^{*}=T^{*} \widehat{\otimes} S^{*}$ is a contraction, the sequence $\left\{(T \widehat{\otimes} S)^{n}(T \widehat{\otimes} S)^{* n}\right\}$ converges strongly to $A_{(T \widehat{\otimes} S)^{*}}=A_{T^{*} \widehat{\otimes} S^{*}}=A_{T^{*}} \widehat{\otimes} A_{S^{*}}$ by (a). If $A_{T \widehat{\otimes} S}=A_{(T \widehat{\otimes} S)^{*}}$, then $A_{T} \widehat{\otimes} A_{S}=A_{T^{*}} \widehat{\otimes} A_{S^{*}}$ by (a). If both $A_{T}$ and $A_{S}$ are nonzero, then $A_{T}=\alpha A_{T^{*}}$ and $A_{S}=\alpha^{-1} A_{S^{*}}$ for some nonzero scalar $\alpha$ [12, Proposition 2.1], and $\left\|A_{T}\right\|=$ $\left\|A_{T^{*}}\right\|=1$. Thus $|\alpha|=1$. Since $A_{T} \geqslant O$, it follows that $\alpha>0$, and so $\alpha=1$. Thus $A_{T}=A_{T^{*}}$ and $A_{S}=A_{S^{*}}$.
(c) If $A_{T \widehat{\otimes} S}=A_{T \widehat{\otimes} S}^{2}$, then $A_{T} \widehat{\otimes} A_{S}=\left(A_{T} \widehat{\otimes} A_{S}\right)^{2}=A_{T}^{2} \widehat{\otimes} A_{S}^{2}$ by (a), which implies that $A_{T}=\alpha A_{T}^{2}$ and $A_{S}=\alpha^{-1} A_{S}^{2}$ for some nonzero scalar $\alpha$ [12, Proposition 2.1], whenever both $A_{T}$ and $A_{S}$ are nonzero. In this case, $\left\|A_{T}\right\|=\left\|A_{S}\right\|=1$ so that
$\left\|A_{T}^{2}\right\| \leqslant 1,\left\|A_{S}^{2}\right\| \leqslant 1$, and hence $\alpha=1$ because $A_{T}$ and $A_{S}$ are nonnegative. Thus $A_{T}=A_{T}^{2}$ and $A_{S}=A_{S}^{2}$.

REMARK 3. Consider the assertions in Corollary 1. According to assertion (a) $A_{T \widehat{\otimes} S}=O$ if and only if either $A_{T}=O$ or $A_{S}=O$. The converse to assertions (b) and (c) hold trivially by (a) - since $\left(A_{T} \widehat{\otimes} A_{S}\right)^{2}=A_{T}^{2} \widehat{\otimes} A_{S}^{2}$. The implications in (b) and (c) do not hold if one of $A_{T}$ or $A_{S}$ is zero.

LEMMA 1. A tensor product $T \widehat{\otimes} S$ in $\mathscr{B}[\mathscr{H} \widehat{\otimes} \mathscr{K}]$ is a unilateral shift if and only if $T \widehat{\otimes} S=J \widehat{\otimes} V$ where $J$ is an isometry in $\mathscr{B}[\mathscr{H}]$ and $V$ is a unilateral shift in $\mathscr{B}[\mathscr{K}]$, or $T \widehat{\otimes} S=V \widehat{\otimes} J$ where $V$ is a unilateral shift in $\mathscr{B}[\mathscr{H}]$ and $J$ is an isometry in $\mathscr{B}[\mathscr{K}]$.

Proof. A unilateral shift is precisely an isometry whose adjoint is strongly stable (cf. [5, Lemma 6.1]). Thus $T \widehat{\otimes} S$ is a unilateral shift if and only if

$$
T \widehat{\otimes} S \text { is an isometry } \quad \text { and } \quad(T \widehat{\otimes} S)^{* n} \xrightarrow{s} O .
$$

But, for any pair of nonzero operators $T$ and $S$,

$$
T \widehat{\otimes} S \text { is an isometry } \quad \Longleftrightarrow \quad T \widehat{\otimes} S=J_{1} \widehat{\otimes} J_{2}
$$

where, $J_{1}$ and $J_{2}$ are isometries in $\mathscr{B}[\mathscr{H}]$ and $\mathscr{B}[\mathscr{K}]$ (see e.g., $[8$, Lemma 4(b)]), and

$$
\left(J_{1} \widehat{\otimes} J_{2}\right)^{* n} \xrightarrow{s} O \quad \Longleftrightarrow \quad J_{1}^{* n} \xrightarrow{s} O \quad \text { or } \quad J_{2}^{* n} \xrightarrow{s} O
$$

(Theorems 2 and 3). Thus $T \widehat{\otimes} S$ is a unilateral shift if and only if $T \widehat{\otimes} S=J_{1} \widehat{\otimes} J_{2}$, where $J_{1}$ and $J_{2}$ are isometries and one of them has a strongly stable adjoint. Equivalently, $J_{1}$ and $J_{2}$ are isometries and one of them is a unilateral shift.

The closing result exhibits a decomposition of a tensor product of contractions for which the strong limit $A_{T} \widehat{\otimes} S$ is a projection. Here $\oplus$ stands for orthogonal direct sum, and $\cong$ stands for unitary equivalence.

THEOREM 4. Let $T$ and $S$ be contractions on $\mathscr{H}$ and $\mathscr{K}$ and consider the tensor product $T \widehat{\otimes} S$ on $\mathscr{H} \widehat{\otimes} \mathscr{K}$.
(a)

$$
\text { If } \quad A_{T \widehat{\otimes} S}=A_{T \widehat{\otimes} S}^{2}, \quad \text { then } \quad T \widehat{\otimes} S \cong B \oplus G \oplus V \oplus U
$$

where $B$ is a $\mathscr{C}_{00}$-contraction, $G$ is a $\mathscr{C}_{0}$ - -contraction (i.e., a strongly stable contraction ), $V$ is a unilateral shift, and $U$ is a unitary operator.

$$
\begin{equation*}
\text { If } \quad A_{T \widehat{\otimes} S}=A_{(T \widehat{\otimes} S)^{*}}, \quad \text { then } \quad T \widehat{\otimes} S \cong B \oplus U \tag{b}
\end{equation*}
$$

Proof. Suppose $T$ and $S$ are contractions. If one of $A_{T}$ or $A_{S}$ is zero, then $A_{T \widehat{\otimes} S}$ is zero, which means that $T \widehat{\otimes} S$ is strongly stable, and so (a) holds with $T \widehat{\otimes} S=B \oplus G$ and (b) holds with $T \widehat{\otimes} S=B$. Thus suppose both $A_{T}$ and $A_{S}$ are nonzero.
(a) If $A_{T \widehat{\otimes} S}=A_{T \widehat{\otimes} S}^{2}$, then $A_{T}=A_{T}^{2}$ and $A_{S}=A_{S}^{2}$ by Corollary 1. Moreover,

$$
\begin{aligned}
A_{T}=A_{T}^{2} & \Longrightarrow \quad T=G_{T} \oplus V_{T} \oplus U_{T} \\
A_{S}=A_{S}^{2} & \Longrightarrow \quad S=G_{S} \oplus V_{S} \oplus U_{S}
\end{aligned}
$$

where $G_{T}$ and $G_{S}$ are $\mathscr{C}_{0}$. -contractions, $V_{T}$ and $V_{S}$ are unilateral shifts, and $U_{T}$ and $U_{S}$ are unitary operators [9, Theorem 1]. Therefore (see [6, Eq. (14),(16)]),

$$
\begin{aligned}
& T \widehat{\otimes} S \cong\left(G_{T} \widehat{\otimes} G_{S}\right) \oplus\left(G_{T} \widehat{\otimes} V_{S}\right) \oplus\left(G_{T} \widehat{\otimes} U_{S}\right) \\
& \oplus\left(V_{T} \widehat{\otimes} G_{S}\right) \oplus\left(V_{T} \widehat{\otimes} V_{S}\right) \oplus\left(V_{T} \widehat{\otimes} U_{S}\right) \\
& \oplus\left(U_{T} \widehat{\otimes} G_{S}\right) \oplus\left(U_{T} \widehat{\otimes} V_{S}\right) \oplus\left(U_{T} \widehat{\otimes} U_{S}\right)
\end{aligned}
$$

which yields the decomposition in (a) with

$$
\begin{gathered}
B=\left(V_{T} \widehat{\otimes} G_{S}\right) \oplus\left(G_{T} \widehat{\otimes} V_{S}\right), \\
G=\left(G_{T} \widehat{\otimes} G_{S}\right) \oplus\left(G_{T} \widehat{\otimes} U_{S}\right) \oplus\left(U_{T} \widehat{\otimes} G_{S}\right), \\
V=\left(V_{T} \widehat{\otimes} V_{S}\right) \oplus\left(V_{T} \widehat{\otimes} U_{S}\right) \oplus\left(U_{T} \widehat{\otimes} V_{S}\right) \quad \text { and } \quad U=U_{T} \widehat{\otimes} U_{S}
\end{gathered}
$$

Since $G_{T}$ and $G_{S}$ are strongly stable, it follows by Theorem 2 that both $V_{T} \widehat{\otimes} G_{S}$ and $G_{T} \widehat{\otimes} V_{S}$ are strongly stable. Since $V_{S}$ and $V_{T}$ are unilateral shifts, their adjoint are strongly stable, and another application of Theorem 2 ensure that $\left(V_{T} \widehat{\otimes} G_{S}\right)^{*}$ and $\left(G_{T} \widehat{\otimes} V_{S}\right)^{*}$ are strongly stable. Thus the contractions $V_{T} \widehat{\otimes} G_{S}$ and $G_{T} \widehat{\otimes} V_{S}$ are of class $\mathscr{C}_{00}$, and so is their direct sum $B$. Theorem 2 also ensures that all the direct summands of $G$ are strongly stable, and so is $G$ itself. Lemma 1 says that all the direct summands of $V$ are unilateral shifts, and so $V$ is a unilateral shift (of higher multiplicity). Finally, $U$ clearly is unitary once $U_{T}$ and $U_{S}$ are.
(b) If $A_{T \widehat{\otimes} S}=A_{(T \widehat{\otimes} S)^{*}}$, then $A_{T}=A_{T^{*}}$ and $A_{S}=A_{S^{*}}$ by Corollary 1. Moreover,

$$
\begin{aligned}
A_{T}=A_{T^{*}} & \Longrightarrow \quad T=B_{T} \oplus U_{T} \\
A_{S}=A_{S^{*}} & \Longrightarrow \quad S=B_{S} \oplus U_{S}
\end{aligned}
$$

where $B_{T}$ and $B_{S}$ are $\mathscr{C}_{00}$-contractions, and $U_{T}$ and $U_{S}$ are unitary operators $[9$, Corollary 1]. Thus, as before,

$$
T \widehat{\otimes} S \cong\left(B_{T} \widehat{\otimes} B_{S}\right) \oplus\left(B_{T} \widehat{\otimes} U_{S}\right) \oplus\left(U_{T} \widehat{\otimes} B_{S}\right) \oplus\left(U_{T} \widehat{\otimes} U_{S}\right)
$$

which yields the decomposition in (b) with

$$
B=\left(B_{T} \widehat{\otimes} B_{S}\right) \oplus\left(B_{T} \widehat{\otimes} U_{S}\right) \oplus\left(U_{T} \widehat{\otimes} B_{S}\right) \quad \text { and } \quad U=U_{T} \widehat{\otimes} U_{S}
$$

where $B$ is a $\mathscr{C}_{00}$-contraction because both $B_{T}$ and $B_{S}$ are, and $U$ is unitary because both $U_{T}$ and $U_{S}$ are.

Acknowledgment. We thank the anonymous referee who brought to our attention an important correction in the weak stability proof of a previous version of Theorem 3.
