# ON THE BOUNDEDNESS OF SUBSEQUENCES OF VILENKIN-FEJÉR MEANS ON THE MARTINGALE HARDY SPACES 

Lars-Erik Persson, George Tephnadze and Georgi Tutberidze

(Communicated by I. M. Spitkovsky)

Abstract. In this paper we characterize subsequences of Fejér means with respect to Vilenkin systems, which are bounded from the Hardy space $H_{p}$ to the Lebesgue space $L_{p}$, for all $0<$ $p<1 / 2$. The result is in a sense sharp.

## 1. Introduction

In the one-dimensional case the weak $(1,1)$-type inequality for the maximal operator of Fejér means

$$
\sigma^{*} f:=\sup _{n \in \mathbb{N}}\left|\sigma_{n} f\right|
$$

can be found in Schipp [12] for Walsh series and in Pál, Simon [10] for bounded Vilenkin series. Here, as usual, the symbol $\sigma_{n}$ denotes the Fejér mean with respect to the Vilenkin system (and thus also called the Vilenkin-Fejér means, see Section 2).

Fujji [6] and Simon [14] verified that $\sigma^{*}$ is bounded from $H_{1}$ to $L_{1}$. Weisz [23] generalized this result and proved boundedness of $\sigma^{*}$ from the martingale space $H_{p}$ to the Lebesgue space $L_{p}$ for $p>1 / 2$. Simon [13] gave a counterexample, which shows that boundedness does not hold for $0<p<1 / 2$. A counterexample for $p=1 / 2$ was given by Goginava [8] (see also [2] and [3]). Weisz [24] proved that the maximal operator of the Fejér means $\sigma^{*}$ is bounded from the Hardy space $H_{1 / 2}$ to the space weak $-L_{1 / 2}$. The boundedness of weighted maximal operators are considered in [9], [16] and [17].

Weisz [22] (see also [21]) also proved that the following theorem is true:
Theorem W:(Weisz). Let $p>0$. Then the maximal operator

$$
\begin{equation*}
\sigma^{\nabla, *} f=\sup _{n \in \mathbb{N}}\left|\sigma_{M_{n}} f\right| \tag{1}
\end{equation*}
$$

[^0]where $M_{0}:=1, M_{n+1}:=m_{n} M_{n}(n \in \mathbb{N})$ and $m:=\left(m_{0}, m_{1}, \ldots\right)$ be a sequences of the positive integers not less than 2, which generate Vilenkin systems, is bounded from the Hardy space $H_{p}$ to the space $L_{p}$.

In [11] the result of Weisz was generalized and it was found the maximal subspace $S \subset \mathbb{N}$ of positive numbers, for which the restricted maximal operator on this subspace
$\sup \left|\sigma_{n} f\right|$ of Fejér means is bounded from the Hardy space $H_{p}$ to the space $L_{p}$ for $n \in S \subset \mathbb{N}$
all $0<p \leqslant 1 / 2$. The new theorem (Theorem 1) in this paper show in particular that this result is in a sense sharp. In particular, for every natural number $n=\sum_{k=0}^{\infty} n_{k} M_{k}$, where $n_{k} \in Z_{m_{k}}\left(k \in \mathbb{N}_{+}\right)$we define numbers

$$
\langle n\rangle:=\min \left\{j \in \mathbb{N}: n_{j} \neq 0\right\}, \quad|n|:=\max \left\{j \in \mathbb{N}: n_{j} \neq 0\right\}, \quad \rho(n)=|n|-\langle n\rangle
$$

and prove that

$$
S=\{n \in \mathbb{N}: \rho(n) \leqslant c<\infty .\}
$$

Since $\rho\left(M_{n}\right)=0$ for all $n \in \mathbb{N}$ we obtain that $\left\{M_{n}: n \in \mathbb{N}\right\} \subset S$ and that follows i.e. that result of Weisz [22] (see also [21]) that restricted maximal operator (1) is bounded from the Hardy space $H_{p}$ to the space $L_{p}$.

The main aim of this paper is to generalize Theorem W and find the maximal subspace of positive numbers, for which the restricted maximal operator of Fejér means in this subspace is bounded from the Hardy space $H_{p}$ to the space $L_{p}$ for all $0<p \leqslant$ $1 / 2$. As applications, both some well-known and new results are pointed out.

This paper is organized as follows: In order not to disturb our discussions later on some preliminaries (definitions, notations and lemmas) are presented in Section 2. The main result (Theorem 1) and some of its consequences can be found in Section 3. The detailed proof of Theorem 1 is given in Section 4.

## 2. Preliminaries

Denote by $\mathbb{N}_{+}$the set of the positive integers, $\mathbb{N}:=\mathbb{N}_{+} \cup\{0\}$. Let $m:=\left(m_{0}, m_{1}, \ldots\right)$ be a sequence of the positive integers not less than 2. Denote by $Z_{m_{n}}:=\left\{0,1, \ldots, m_{n}-\right.$ $1\}$ the additive group of integers modulo $m_{n}$. Define the group $G_{m}$ as the complete direct product of the groups $Z_{m_{n}}$ with the product of the discrete topologies of $Z_{m_{n}}$ 's. In this paper we discuss bounded Vilenkin groups, i.e. the case when $\sup _{n \in \mathbb{N}} m_{n}<\infty$.

The direct product $\mu$ of the measures $\mu_{n}(\{j\}):=1 / m_{n},\left(j \in Z_{m_{n}}\right)$ is the Haar measure on $G_{m}$ with $\mu\left(G_{m}\right)=1$.

The elements of $G_{m}$ are represented by sequences

$$
x:=\left(x_{0}, x_{1}, \ldots, x_{n}, \ldots\right),\left(x_{n} \in Z_{m_{n}}\right)
$$

It is easy to give a base for the neighbourhood of $G_{m}$ :

$$
I_{0}(x):=G_{m}, I_{n}(x):=\left\{y \in G_{m} \mid y_{0}=x_{0}, \ldots, y_{n-1}=x_{n-1}\right\}\left(x \in G_{m}, n \in \mathbb{N}\right)
$$

Set $I_{n}:=I_{n}(0)$, for $n \in \mathbb{N}_{+}$and

$$
e_{n}:=\left(0, \ldots, 0, x_{n}=1,0, \ldots\right) \in G_{m} \quad(n \in \mathbb{N}) .
$$

Denote

$$
I_{N}^{k, l}:=\left\{\begin{array}{l}
I_{N}\left(0, \ldots, 0, x_{k} \neq 0,0, \ldots, 0, x_{l} \neq 0, x_{l+1, \ldots,}, x_{N-1}\right), \quad k<l<N \\
I_{N}\left(0, \ldots, 0, x_{k} \neq 0,0, \ldots, 0\right), \quad l=N
\end{array}\right.
$$

It is easy to show that

$$
\begin{equation*}
\overline{I_{N}}=\left(\bigcup_{i=0}^{N-2} \bigcup_{j=i+1}^{N-1} I_{N}^{i, j}\right) \bigcup\left(\bigcup_{i=0}^{N-1} I_{N}^{i, N}\right), \quad n=2,3, \ldots \tag{2}
\end{equation*}
$$

If we define the so-called generalized number system based on $m$ in the following way:

$$
M_{0}:=1, M_{n+1}:=m_{n} M_{n} \quad(n \in \mathbb{N})
$$

then every $n \in \mathbb{N}$ can be uniquely expressed as $n=\sum_{k=0}^{\infty} n_{k} M_{k}$, where $n_{k} \in Z_{m_{k}}(k \in$ $\mathbb{N}_{+}$) and only a finite number of $n_{k}$ 's differ from zero. Let

$$
\langle n\rangle:=\min \left\{j \in \mathbb{N}: n_{j} \neq 0\right\} \quad \text { and } \quad|n|:=\max \left\{j \in \mathbb{N}: n_{j} \neq 0\right\},
$$

that is $M_{|n|} \leqslant n \leqslant M_{|n|+1}$. Set $\rho(n)=|n|-\langle n\rangle$, for all $n \in \mathbb{N}$.
Next, we introduce on $G_{m}$ an orthonormal system, which is called the Vilenkin system. At first, we define the complex-valued function $r_{k}(x): G_{m} \rightarrow \mathbb{C}$, the generalized Rademacher functions, by

$$
r_{k}(x):=\exp \left(2 \pi i x_{k} / m_{k}\right),\left(i^{2}=-1, x \in G_{m}, k \in \mathbb{N}\right)
$$

Now, define the Vilenkin system $\psi:=\left(\psi_{n}: n \in \mathbb{N}\right)$ on $G_{m}$ as:

$$
\psi_{n}(x):=\prod_{k=0}^{\infty} r_{k}^{n_{k}}(x) \quad(n \in \mathbb{N})
$$

Specifically, we call this system the Walsh-Paley system, when $m \equiv 2$.
The norms (or quasi-norms) of the spaces $L_{p}\left(G_{m}\right)$ and weak $-L_{p}\left(G_{m}\right)(0<p<\infty)$ are respectively defined by

$$
\|f\|_{p}^{p}:=\int_{G_{m}}|f|^{p} d \mu, \quad\|f\|_{\text {weak- } L_{p}}^{p}:=\sup _{\lambda>0} \lambda^{p} \mu(f>\lambda)<\infty .
$$

The Vilenkin system is orthonormal and complete in $L_{2}\left(G_{m}\right)$ (see [20]).
If $f \in L_{1}\left(G_{m}\right)$ we can define Fourier coefficients, partial sums, Dirichlet kernels, Fejér means, Fejér kernels with respect to the Vilenkin system in the usual manner:

$$
\widehat{f}(k):=\int_{G_{m}} f \bar{\psi}_{k} d \mu \quad(k \in \mathbb{N})
$$

$$
\begin{array}{rlrl}
S_{n} f: & =\sum_{k=0}^{n-1} \widehat{f}(k) \psi_{k}, & D_{n}:=\sum_{k=0}^{n-1} \psi_{k} & \left(n \in \mathbb{N}_{+}\right), \\
\sigma_{n} f:=\frac{1}{n} \sum_{k=0}^{n-1} S_{k} f, & K_{n}:=\frac{1}{n} \sum_{k=0}^{n-1} D_{k} & \left(n \in \mathbb{N}_{+}\right) .
\end{array}
$$

Recall that (see e.g. [1])

$$
D_{M_{n}}(x)= \begin{cases}M_{n}, & \text { if } x \in I_{n}  \tag{3}\\ 0, & \text { if } x \notin I_{n}\end{cases}
$$

and

$$
\begin{equation*}
D_{s_{n} M_{n}}=D_{s_{n} M_{n}} \sum_{k=0}^{s_{n}-1} \psi_{k M_{n}}=D_{M_{n}} \sum_{k=0}^{s_{n}-1} r_{n}^{k} \tag{4}
\end{equation*}
$$

where $n \in \mathbb{N}$ and $1 \leqslant s_{n} \leqslant m_{n}-1$.
The $\sigma$-algebra generated by the intervals $\left\{I_{n}(x): x \in G_{m}\right\}$ will be denoted by $\digamma_{n}$ $(n \in \mathbb{N})$. Denote by $f=\left(f^{(n)}, n \in \mathbb{N}\right)$ a martingale with respect to $\digamma_{n}(n \in \mathbb{N})$ (for details see e.g. [21]). The maximal function of a martingale $f$ is defined by

$$
f^{*}=\sup _{n \in \mathbb{N}}\left|f^{(n)}\right|
$$

In the case $f \in L_{1}\left(G_{m}\right)$, the maximal functions are just also given by

$$
f^{*}(x)=\sup _{n \in \mathbb{N}} \frac{1}{\left|I_{n}(x)\right|}\left|\int_{I_{n}(x)} f(u) \mu(u)\right| .
$$

For $0<p<\infty$ the Hardy martingale spaces $H_{p}\left(G_{m}\right)$ consist of all martingales $f$, for which

$$
\|f\|_{H_{p}}:=\left\|f^{*}\right\|_{p}<\infty
$$

If $f \in L_{1}\left(G_{m}\right)$, then it is easy to show that the sequence $\left(S_{M_{n}}(f): n \in \mathbb{N}\right)$ is a martingale. If $f=\left(f^{(n)}, n \in \mathbb{N}\right)$ is a martingale, then the Vilenkin-Fourier coefficients must be defined in a slightly different manner:

$$
\widehat{f}(i):=\lim _{k \rightarrow \infty} \int_{G_{m}} f^{(k)}(x) \bar{\psi}_{i}(x) d \mu(x)
$$

The Vilenkin-Fourier coefficients of $f \in L_{1}\left(G_{m}\right)$ are the same as those of the martingale $\left(S_{M_{n}} f: n \in \mathbb{N}\right)$ obtained from $f$.

A bounded measurable function $a$ is said to be a p-atom if there exists an interval $I$, such that

$$
\int_{I} a d \mu=0, \quad\|a\|_{\infty} \leqslant \mu(I)^{-1 / p}, \quad \operatorname{supp}(a) \subset I
$$

For the proof of the main result (Theorem 1) we need the following Lemmas:

LEMMA 1. (see e.g. [22]) A martingale $f=\left(f^{(n)}, n \in \mathbb{N}\right)$ is in $H_{p}(0<p \leqslant 1)$ if and only if there exist a sequence $\left(a_{k}, k \in \mathbb{N}\right)$ of $p$-atoms and a sequence $\left(\mu_{k}, k \in \mathbb{N}\right)$ of real numbers such that for every $n \in \mathbb{N}$ :

$$
\begin{equation*}
\sum_{k=0}^{\infty} \mu_{k} S_{M_{n}} a_{k}=f^{(n)} \tag{5}
\end{equation*}
$$

and

$$
\sum_{k=0}^{\infty}\left|\mu_{k}\right|^{p}<\infty .
$$

Moreover, $\|f\|_{H_{p}} \backsim \inf \left(\sum_{k=0}^{\infty}\left|\mu_{k}\right|^{p}\right)^{1 / p}$, where the infimum is taken over all decomposition of $f$ of the form (5).

LEMMA 2. (see e.g. [22]) Suppose that an operator $T$ is $\sigma$-linear and for some $0<p \leqslant 1$

$$
\int_{\bar{I}}|T a|^{p} d \mu \leqslant c_{p}<\infty
$$

for every p-atom a, where I denotes the support of the atom. If $T$ is bounded from $L_{\infty}$ to $L_{\infty}$, then

$$
\|T f\|_{p} \leqslant c_{p}\|f\|_{H_{p}}
$$

Lemma 3. (see [7]) Let $n>t, t, n \in \mathbb{N}, x \in I_{t} \backslash I_{t+1}$. Then

$$
K_{M_{n}}(x)= \begin{cases}0, & \text { if } x-x_{t} e_{t} \notin I_{n}, \\ \frac{M_{t}}{1-r_{t}(x)}, & \text { if } x-x_{t} e_{t} \in I_{n}\end{cases}
$$

Lemma 4. (see [17]) Let $x \in I_{N}^{i, j}, i=0, \ldots, N-1, j=i+1, \ldots, N$. Then

$$
\int_{I_{N}}\left|K_{n}(x-t)\right| d \mu(t) \leqslant \frac{c M_{i} M_{j}}{M_{N}^{2}}, \text { for } n \geqslant M_{N}
$$

Lemma 5. (see [11]) Let $n \in \mathbb{N}$. Then

$$
\begin{equation*}
\left|K_{n}(x)\right| \leqslant \frac{c}{n} \sum_{l=\langle n\rangle}^{|n|} M_{l}\left|K_{M_{l}}\right| \leqslant c \sum_{l=\langle n\rangle}^{|n|}\left|K_{M_{l}}\right| \tag{6}
\end{equation*}
$$

and

$$
\begin{equation*}
\left|n K_{n}\right| \geqslant \frac{M_{\langle n\rangle}^{2}}{2 \pi \lambda}, \quad x \in I_{\langle n\rangle+1}\left(e_{\langle n\rangle-1}+e_{\langle n\rangle}\right) \tag{7}
\end{equation*}
$$

where $\lambda:=\sup m_{n}$.

## 3. The main result and applications

Our main result reads:
THEOREM 1. a) Let $0<p<1 / 2, f \in H_{p}$. Then there exists an absolute constant $c_{p}$, depending only on $p$, such that

$$
\left\|\sigma_{n_{k}} f\right\|_{H_{p}} \leqslant \frac{c_{p} M_{\left|n_{k}\right|}^{1 / p-2}}{M_{\left\langle n_{k}\right\rangle}^{1 / p-2}}\|f\|_{H_{p}}
$$

b) (sharpness) Let $0<p<1 / 2$ and $\Phi(n)$ be any nondecreasing function, such that

$$
\begin{equation*}
\sup _{k \in \mathbb{N}} \rho\left(n_{k}\right)=\infty, \quad \varlimsup_{k \rightarrow \infty} \frac{M_{\left|n_{k}\right|}^{1 / p-2}}{M_{\left\langle n_{k}\right\rangle}^{1 / p-2} \Phi\left(n_{k}\right)}=\infty . \tag{8}
\end{equation*}
$$

Then there exists a martingale $f \in H_{p}$, such that

$$
\sup _{k \in \mathbb{N}}\left\|\frac{\sigma_{n_{k}} f}{\Phi\left(n_{k}\right)}\right\|_{\text {weak }-L_{p}}=\infty
$$

Corollary 1. Let $0<p<1 / 2$, and $f \in H_{p}$. Then there exists an absolute constant $c_{p}$, depending only on $p$, such that

$$
\left\|\sigma_{n_{k}} f\right\|_{H_{p}} \leqslant c_{p}\|f\|_{H_{p}}, \quad k \in \mathbb{N}
$$

if and only if

$$
\sup _{k \in \mathbb{N}} \rho\left(n_{k}\right)<c<\infty .
$$

As an application we also obtain the previous mentioned result by Weisz [21], [22] (Theorem W).

COROLLARY 2. Let $0<p<1 / 2, f \in H_{p}$. Then there exists an absolute constant $c_{p}$, depending only on $p$, such that

$$
\left\|\sigma_{M_{n}} f\right\|_{H_{p}} \leqslant c_{p}\|f\|_{H_{p}}, \quad n \in \mathbb{N}
$$

On the other hand, the following unexpected result is true:
Corollary 3. a) Let $0<p<1 / 2, f \in H_{p}$. Then there exists an absolute constant $c_{p}$, depending only on $p$, such that

$$
\left\|\sigma_{M_{n}+1} f\right\|_{H_{p}} \leqslant c_{p} M_{n}^{1 / p-2}\|f\|_{H_{p}}, \quad n \in \mathbb{N}
$$

b) Let $0<p<1 / 2$ and $\Phi(n)$ be any nondecreasing function, such that

$$
\varlimsup_{k \rightarrow \infty} \frac{M_{k}^{1 / p-2}}{\Phi(k)}=\infty
$$

Then there exists a martingale $f \in H_{p}$, such that

$$
\sup _{k \in \mathbb{N}}\left\|\frac{\sigma_{M_{k}+1} f}{\Phi(k)}\right\|_{\text {weak- }-L_{p}}=\infty
$$

REMARK 1. From Corollary 2 we obtain that $\sigma_{M_{n}}$ are bounded from $H_{p}$ to $H_{p}$, but from Corollary 3 we conclude that $\sigma_{M_{n}+1}$ are not bounded from $H_{p}$ to $H_{p}$. The main reason is that Fourier coefficients of martingales $f \in H_{p}$ are not uniformly bounded (for details see e.g. [18]).

In the next corollary we state some estimates for the Walsh system only to clearly see the difference of divergence rates for the various subsequences:

COROLLARY 4. a)Let $0<p<1 / 2, f \in H_{p}$. Then there exists an absolute constant $c_{p}$, depending only on $p$, such that

$$
\begin{equation*}
\left\|\sigma_{2^{n}+1} f\right\|_{H_{p}} \leqslant c_{p} 2^{(1 / p-2) n}\|f\|_{H_{p}}, \quad n \in \mathbb{N} \tag{9}
\end{equation*}
$$

and

$$
\begin{equation*}
\left\|\sigma_{2^{n}+2^{[n / 2]}} f\right\|_{H_{p}} \leqslant c_{p} 2^{\frac{(1 / p-2) n}{2}}\|f\|_{H_{p}}, \quad n \in \mathbb{N} \tag{10}
\end{equation*}
$$

where $[n / 2]$ denotes an integer part of $n / 2$.
b) The rates $2^{(1 / p-2) n}$ and $2^{\frac{(1 / p-2) n}{2}}$ in inequalities (9) and (10) are sharp in the same sense as in Theorem 1.

## 4. Proof of Theorem 1

Proof. a) Since

$$
\begin{equation*}
\sup _{n \in \mathbb{N}} \int_{G_{m}}\left|K_{n}(x)\right| d \mu(x) \leqslant c<\infty \tag{11}
\end{equation*}
$$

we obtain that

$$
\frac{M_{\left\langle n_{k}\right\rangle}^{1 / p-2}\left|\sigma_{n_{k}} a(x)\right|}{M_{\left|n_{k}\right|}^{1 / p-2}}
$$

is bounded from $L_{\infty}$ to $L_{\infty}$. According to Lemma 2 we find that the proof of Theorem 1 will be complete, if we show that

$$
\int_{I_{N}}\left|\frac{M_{\left\langle n_{k}\right\rangle}^{1 / p-2} \sigma_{n_{k}} a(x)}{M_{\left|n_{k}\right|}^{1 / p-2}}\right|^{p}<c<\infty
$$

for every $p$-atom $a$, with support $I$ and $\mu(I)=M_{N}^{-1}$. We may assume that $I=I_{N}$. It is easy to see that $\sigma_{n_{k}}(a)=0$ when $n_{k} \leqslant M_{N}$. Therefore, we can suppose that $n_{k}>M_{N}$.

Since $\|a\|_{\infty} \leqslant M_{N}^{1 / p}$ we find that

$$
\begin{align*}
& \frac{M_{\left\langle n_{k}\right\rangle}^{1 / p-2}\left|\sigma_{n_{k}} a(x)\right|}{M_{\left|n_{k}\right|}^{1 / p-2}} \leqslant \frac{M_{\left\langle n_{k}\right\rangle}^{1 / p-2}}{M_{\left|n_{k}\right|}^{1 / p-2}} \int_{I_{N}}|a(t)|\left|K_{n_{k}}(x-t)\right| d \mu(t)  \tag{12}\\
\leqslant & \frac{M_{\left\langle n_{k}\right\rangle}^{1 / p-2}\|a\|_{\infty}}{M_{\left|n_{k}\right|}^{1 / p-2}} \int_{I_{N}}\left|K_{n_{k}}(x-t)\right| d \mu(t) \leqslant \frac{M_{\left\langle n_{k}\right\rangle}^{1 / p-2} M_{N}^{1 / p}}{M_{\left|n_{k}\right|}^{1 / p-2}} \int_{I_{N}}\left|K_{n_{k}}(x-t)\right| d \mu(t) \\
\leqslant & M_{\left\langle n_{k}\right\rangle}^{1 / p-2} M_{\left|n_{k}\right|}^{2} \int_{I_{N}}\left|K_{n_{k}}(x-t)\right| d \mu(t) .
\end{align*}
$$

Without loss the generality we may assume that $i<j$. Let $x \in I_{N}^{i, j}$ and $j<\left\langle n_{k}\right\rangle$. Then $x-t \in I_{N}^{i, j}$ for $t \in I_{N}$ and, according to Lemma 3, we obtain that

$$
\left|K_{M_{l}}(x-t)\right|=0, \text { for all }\left\langle n_{k}\right\rangle \leqslant l \leqslant\left|n_{k}\right| .
$$

By applying (12) and (6) in Lemma 5, for $x \in I_{N}^{i, j}, 0 \leqslant i<j<\left\langle n_{k}\right\rangle$ we get that

$$
\begin{equation*}
\frac{M_{\left\langle n_{k}\right\rangle}^{1 / p-2}\left|\sigma_{n_{k}} a(x)\right|}{M_{\left|n_{k}\right|}^{1 / p-2}} \leqslant M_{\left\langle n_{k}\right\rangle}^{1 / p-2} M_{\left|n_{k}\right|}^{2} \sum_{l=\left\langle n_{k}\right\rangle}^{\left|n_{k}\right|} \int_{I_{N}}\left|K_{M_{l}}(x-t)\right| d \mu(t)=0 . \tag{13}
\end{equation*}
$$

Let $x \in I_{N}^{i, j}$, where $\left\langle n_{k}\right\rangle \leqslant j \leqslant N$. Then, in the view of Lemma 4, we have that

$$
\int_{I_{N}}\left|K_{n_{k}}(x-t)\right| d \mu(t) \leqslant \frac{c M_{i} M_{j}}{M_{N}^{2}}
$$

By using again (12) we find that

$$
\begin{align*}
\frac{M_{\left\langle n_{k}\right\rangle}^{1 / p-2}\left|\sigma_{n_{k}} a(x)\right|}{M_{\left|n_{k}\right|}^{1 / p-2}} & \leqslant \frac{M_{\left\langle n_{k}\right\rangle}^{1 / p-2} M_{N}^{1 / p}}{M_{\left|n_{k}\right|}^{1 / p-2}} \int_{I_{N}}\left|K_{n_{k}}(x-t)\right| d \mu(t)  \tag{14}\\
& \leqslant \frac{M_{\left\langle n_{k}\right\rangle}^{1 / p-2} M_{N}^{1 / p}}{M_{\left|n_{k}\right|}^{1 / p-2}} \frac{M_{i} M_{j}}{M_{N}^{2}} \leqslant M_{\left\langle n_{k}\right\rangle}^{1 / p-2} M_{i} M_{j} .
\end{align*}
$$

By combining (2) and (12)-(14) we get that

$$
\begin{aligned}
& \int_{\overline{I_{N}}}\left|\frac{M_{\left\langle n_{k}\right\rangle}^{1 / p-2}\left|\sigma_{n_{k}} a(x)\right|}{M_{\left|n_{k}\right|}^{1 / p-2}}\right|^{p} d \mu \\
= & \sum_{i=0}^{N-2} \sum_{j=i+1}^{N-1} \int_{I_{N}^{i, j}}\left|\frac{M_{\left\langle n_{k}\right\rangle}^{1 / p-2}\left|\sigma_{n_{k}} a(x)\right|}{M_{\left|n_{k}\right|}^{1 / p-2}}\right|^{p} d \mu+\sum_{i=0}^{N-1} \int_{I_{N}^{k, N}}\left|\frac{M_{\left\langle n_{k}\right\rangle}^{1 / p-2}\left|\sigma_{n_{k}} a(x)\right|}{M_{\left|n_{k}\right|}^{1 / p-2}}\right|^{p} d \mu \\
\leqslant & \sum_{i=0}^{\left\langle n_{k}\right\rangle-1} \sum_{j=\left\langle n_{k}\right\rangle}^{N-1} \int_{I_{N}^{i, j}}\left|\frac{M_{\left\langle n_{k}\right\rangle}^{1 / p-2}\left|\sigma_{n_{k}} a(x)\right|}{M_{\left|n_{k}\right|}^{1 / p-2}}\right|^{p} d \mu+\sum_{i=\left\langle n_{k}\right\rangle}^{N-2} \sum_{j=i+1}^{N-1} \int_{I_{N}^{i, j}}\left|\frac{M_{\left\langle n_{k}\right\rangle}^{1 / p-2}\left|\sigma_{n_{k}} a(x)\right|}{M_{\left|n_{k}\right|}^{1 / p-2}}\right|^{p} d \mu
\end{aligned}
$$

$$
\begin{aligned}
& +\sum_{i=0}^{N-1} \int_{I_{N}^{i, N}}\left|\frac{M_{\left\langle n_{k}\right\rangle}^{1 / p-2} \mid \sigma_{n_{k}} a(x)}{M_{\left|n_{k}\right|}^{1 / p-2}}\right|^{p} d \mu \\
\leqslant & \sum_{i=0}^{\left\langle n_{k}\right\rangle-1} \sum_{j=\left\langle n_{k}\right\rangle}^{N-1} \int_{I_{N}^{i, j}}\left|M_{\left\langle n_{k}\right\rangle}^{1 / p-2} M_{i} M_{j}\right|^{p} d \mu+\sum_{i=\left\langle n_{k}\right\rangle}^{N-2} \sum_{j=i+1}^{N-1} \int_{I_{N}^{i, j}}\left|M_{\left\langle n_{k}\right\rangle}^{1 / p-2} M_{i} M_{j}\right|^{p} d \mu \\
& +\sum_{i=0}^{N-1} \int_{I_{N}^{i, N}}\left|M_{\left\langle n_{k}\right\rangle}^{1 / p-2} M_{i} M_{N}\right|^{p} d \mu \\
\leqslant & c_{p} M_{\left\langle n_{k}\right\rangle}^{1-2 p} \sum_{i=0}^{\left\langle n_{k}\right\rangle-1} \sum_{j=\left\langle n_{k}\right\rangle}^{N-1} \frac{\left(M_{i} M_{j}\right)^{p}}{M_{j}}+c_{p} M_{\left\langle n_{k}\right\rangle}^{1-2 p} \sum_{i=\left\langle n_{k}\right\rangle}^{N-2} \sum_{j=i+1}^{N-1} \frac{\left(M_{i} M_{j}\right)^{p}}{M_{j}}+c_{p} M_{\left\langle n_{k}\right\rangle}^{1-2 p} \sum_{i=0}^{N-1} \frac{\left(M_{i} M_{N}\right)^{p}}{M_{N}} \\
\leqslant & c_{p} M_{\left\langle n_{k}\right\rangle}^{1-2 p} \sum_{i=0}^{\left\langle n_{k}\right\rangle} M_{i}^{p} \sum_{j=\left\langle n_{k}\right\rangle+1}^{N-1} \frac{1}{M_{j}^{1-p}}+M_{\left\langle n_{k}\right\rangle}^{1-2 p} \sum_{i=\left\langle n_{k}\right\rangle}^{N-2} M_{i}^{p} \sum_{j=i+1}^{N-1} \frac{1}{M_{j}^{1-p}}+c_{p} \sum_{i=0}^{N-1} \frac{M_{i}^{p}}{M_{N}^{p}} \\
\leqslant & c_{p} M_{\left\langle n_{k}\right\rangle}^{1-2 p} M_{\left\langle n_{k}\right\rangle}^{p} \frac{1}{M_{\left\langle n_{k}\right\rangle}^{1-p}+c_{p} M_{\left\langle n_{k}\right\rangle}^{1-2 p} \sum_{i=\left\langle n_{k}\right\rangle}^{N-2} \frac{1}{M_{i}^{1-2 p}}+c_{p} \leqslant c_{p}<\infty .}
\end{aligned}
$$

The proof of the a) part is complete.
b) Let $\left\{n_{k}: k \geqslant 0\right\}$ be a sequence of positive numbers, satisfying condition (8).

Then

$$
\begin{equation*}
\sup _{k \in \mathbb{N}} \frac{M_{\left|n_{k}\right|}}{M_{\left\langle n_{k}\right\rangle}}=\infty \tag{15}
\end{equation*}
$$

Under condition (15) there exists a sequence $\left\{\alpha_{k}: k \geqslant 0\right\} \subset\left\{n_{k}: k \geqslant 0\right\}$ such that $\alpha_{0} \geqslant 3$ and

$$
\begin{equation*}
\sum_{k=0}^{\infty} \frac{M_{\left\langle\alpha_{k}\right\rangle}^{(1-2 p) / 2} \Phi^{p / 2}\left(\alpha_{k}\right)}{M_{\left|\alpha_{k}\right|}^{(1-2 p) / 2}}<c<\infty \tag{16}
\end{equation*}
$$

Let

$$
f^{(n)}=\sum_{\left\{k ;\left|\alpha_{k}\right|<n\right\}} \lambda_{k} a_{k},
$$

where

$$
\lambda_{k}=\frac{\lambda M_{\left\langle\alpha_{k}\right\rangle}^{(1 / p-2) / 2} \Phi^{1 / 2}\left(\alpha_{k}\right)}{M_{\left|\alpha_{k}\right|}^{(1 / p-2) / 2}}
$$

and

$$
a_{k}=\frac{M_{\left|\alpha_{k}\right|}^{1 / p-1}}{\lambda}\left(D_{M_{\left|\alpha_{k}\right|+1}}-D_{M_{\left|\alpha_{k}\right|}}\right) .
$$

Here $\lambda=\sup _{n \in \mathbb{N}} m_{n}$. By applying Lemma 1 we can conclude that $f \in H_{p}$.

It is evident that

$$
\widehat{f}(j)=\left\{\begin{array}{l}
M_{\left|\alpha_{k}\right|}^{1 / 2 p} M_{\left\langle\alpha_{k}\right\rangle}^{(1 / p-2) / 2} \Phi^{1 / 2}\left(\alpha_{k}\right)  \tag{17}\\
\text { if } j \in\left\{M_{\left|\alpha_{k}\right|}, \ldots, M_{\left|\alpha_{k}\right|+1}-1\right\}, k=0,1,2 \ldots, \\
0, \\
\text { if } j \notin \bigcup_{k=0}^{\infty}\left\{M_{\left|\alpha_{k}\right|}, \ldots, M_{\left|\alpha_{k}\right|+1}-1\right\}
\end{array}\right.
$$

Moreover,

$$
\frac{\sigma_{\alpha_{k}} f}{\Phi\left(\alpha_{k}\right)}=\frac{1}{\alpha_{k} \Phi\left(\alpha_{k}\right)} \sum_{j=1}^{M_{\left|\alpha_{k}\right|}} S_{j} f+\frac{1}{\alpha_{k} \Phi\left(\alpha_{k}\right)} \sum_{j=M_{\left|\alpha_{k}\right|}+1}^{\alpha_{k}} S_{j} f:=I+I I
$$

Let $M_{\left|\alpha_{k}\right|}<j \leqslant \alpha_{k}$. Then, by applying (17) we get that

$$
\begin{equation*}
S_{j} f=S_{M_{\left|\alpha_{k}\right|}} f+M_{\left|\alpha_{k}\right|}^{1 / 2 p} M_{\left\langle\alpha_{k}\right\rangle}^{(1 / p-2) / 2} \Phi^{1 / 2}\left(\alpha_{k}\right)\left(D_{j}-D_{M_{\left|\alpha_{k}\right|}}\right) \tag{18}
\end{equation*}
$$

By using (18) we can rewrite $I I$ as

$$
\begin{aligned}
I I & =\frac{\alpha_{k}-M_{\left|\alpha_{k}\right|}}{\alpha_{k} \Phi\left(\alpha_{k}\right)} S_{M_{\left|\alpha_{k}\right|}} f+\frac{M_{\left|\alpha_{k}\right|}^{1 / 2 p} M_{\left\langle\alpha_{k}\right\rangle}^{(1 / p-2) / 2}}{\alpha_{k} \Phi^{1 / 2}\left(\alpha_{k}\right)} \sum_{j=M_{\left|\alpha_{k}\right|}}^{\alpha_{k}}\left(D_{j}-D_{M_{\left|\alpha_{k}\right|} \mid}\right) \\
& :=I I_{1}+I I_{2} .
\end{aligned}
$$

Since (for details see e.g. [5] and [19])

$$
\left\|S_{M_{\left|\alpha_{k}\right|}} f\right\|_{\text {weak-L}} \leqslant c_{p}\|f\|_{H_{p}}
$$

we obtain that

$$
\left\|I I_{1}\right\|_{\text {weak-L-Lp }}^{p} \leqslant\left(\frac{\alpha_{k}-M_{\left|\alpha_{k}\right|}}{\alpha_{k} \Phi\left(\alpha_{k}\right)}\right)^{p}\left\|S_{M_{\left|\alpha_{k}\right|} \mid}\right\|_{\text {weak-L}}^{p} \leqslant\left\|S_{M_{\left|\alpha_{k}\right|}} f\right\|_{\text {weak- } L_{p}}^{p} \leqslant c_{p}\|f\|_{H_{p}}^{p}<\infty .
$$

By using part a) of Theorem 1 (see also Corollary 2) we find that

$$
\|I\|_{\text {weak-L-Lp }}^{p}=\left(\frac{M_{\left|\alpha_{k}\right|}}{\alpha_{k} \Phi\left(\alpha_{k}\right)}\right)^{p}\left\|\sigma_{M_{\left|\alpha_{k}\right|} \mid} f\right\|_{\text {weak-L }}^{p} \leqslant c_{p}\|f\|_{H_{p}}^{p}<\infty .
$$

Let $x \in I_{\left\langle\alpha_{k}\right\rangle+1}^{\left\langle\alpha_{k}\right\rangle-1,\left\langle\alpha_{k}\right\rangle}$. Under condition (8) we can conclude that $\left\langle\alpha_{k}\right\rangle \neq\left|\alpha_{k}\right|$ and $\left\langle\alpha_{k}-M_{\left|\alpha_{k}\right|}\right\rangle=\left\langle\alpha_{k}\right\rangle$. Since

$$
\begin{equation*}
D_{j+M_{n}}=D_{M_{n}}+\psi_{M_{n}} D_{j}=D_{M_{n}}+r_{n} D_{j}, \text { when } j<M_{n} \tag{19}
\end{equation*}
$$

if we apply estimate (7) in Lemma 5 for $I I_{2}$ we obtain that

$$
\left|I I_{2}\right|=\frac{M_{\left|\alpha_{k}\right|}^{1 / 2 p} M_{\left\langle\alpha_{k}\right\rangle}^{(1 / p-2) / 2}}{\alpha_{k} \Phi^{1 / 2}\left(\alpha_{k}\right)}\left|\sum_{j=1}^{\alpha_{k}-M_{\left|\alpha_{k}\right|}}\left(D_{j+M_{\left|\alpha_{k}\right|} \mid}-D_{M_{\left|\alpha_{k}\right|}}\right)\right|
$$

$$
\begin{aligned}
& =\frac{M_{\left|\alpha_{k}\right|}^{1 / 2 p} M_{\left\langle\alpha_{k}\right\rangle}^{(1 / p-2) / 2}}{\alpha_{k} \Phi^{1 / 2}\left(\alpha_{k}\right)}\left|\psi_{M_{\left|\alpha_{k}\right|}} \sum_{j=1}^{\alpha_{k}-M_{\left|\alpha_{k}\right|}} D_{j}\right| \\
& \geqslant \frac{c_{p} M_{\left|\alpha_{k}\right|}^{1 / 2 p-1} M_{\left\langle\alpha_{k}\right\rangle}^{(1 / p-2) / 2}}{\Phi^{1 / 2}\left(\alpha_{k}\right)}\left(\alpha_{k}-M_{\left|\alpha_{k}\right|}\right)\left|K_{\alpha_{k}-M_{\left|\alpha_{k}\right|} \mid}\right| \geqslant \frac{c_{p} M_{\left|\alpha_{k}\right|}^{1 / 2 p-1} M_{\left\langle\alpha_{k}\right\rangle}^{(1 / p+2) / 2}}{\Phi^{1 / 2}\left(\alpha_{k}\right)}
\end{aligned}
$$

It follows that

$$
\begin{aligned}
& \left\|I I_{2}\right\|_{\text {weak-L }}^{p} \\
\geqslant & c_{p}\left(\frac{M_{\left|\alpha_{k}\right|}^{(1 / p-2) / 2} M_{\left\langle\alpha_{k}\right\rangle}^{(1 / p+2) / 2}}{\Phi^{1 / 2}\left(\alpha_{k}\right)}\right)^{p} \mu\left\{x \in G_{m}:\left|I V_{2}\right| \geqslant c_{p} M_{\left|\alpha_{k}\right|}^{(1 / p-2) / 2} M_{\left\langle\alpha_{k}\right\rangle}^{(1 / p+2) / 2}\right\} \\
\geqslant & c_{p} \frac{M_{\left|\alpha_{k}\right|}^{1 / 2-p} M_{\left\langle\alpha_{k}\right\rangle}^{1 / 2+p} \mu\left\{I_{\left\langle\alpha_{k}\right\rangle+1}^{\left\langle\alpha_{k}\right\rangle-1,\left\langle\alpha_{k}\right\rangle}\right\}}{\Phi^{p / 2}\left(\alpha_{k}\right)} \geqslant \frac{c_{p} M_{\left|\alpha_{k}\right|}^{1 / 2-p}}{M_{\left\langle\alpha_{k}\right\rangle}^{1 / 2-p} \Phi^{p / 2}\left(\alpha_{k}\right)} .
\end{aligned}
$$

Hence, if we apply (16) for large $k$,

$$
\begin{aligned}
\left\|\sigma_{\alpha_{k}} f\right\|_{\text {weak }-L_{p}}^{p} & \geqslant\left\|I I_{2}\right\|_{\text {weak }-L_{p}}^{p}-\left\|I I_{1}\right\|_{\text {weak }-L_{p}}^{p}-\|I\|_{\text {weak }-L_{p}}^{p} \\
& \geqslant \frac{1}{2}\left\|I I_{2}\right\|_{\text {weak }-L_{p}}^{p} \geqslant \frac{c_{p} M_{\left|\alpha_{k}\right|}^{1 / 2-p}}{2 M_{\left\langle\alpha_{k}\right\rangle}^{1 / 2-p} \Phi^{p / 2}\left(\alpha_{k}\right)} \rightarrow \infty, \text { as } k \rightarrow \infty .
\end{aligned}
$$

The proof is complete.
